EXECUTIVE SUMMARY

Objective:	Phase 1 Desk Study / Preliminary Risk Assessment Report.
The Site:	Land adjacent to Hale View Road, Huyton
The Proposal:	Construction of two detached properties with associated car parking
Site History:	The Appears to have been open space with initially a mineral railway crossing the site which has since been removed
Geology:	Potentially underlain by disturbed / made ground overlying superficial deposits on top of bedrock
Conceptual Site Model:	Potential risks to construction workers
Hazard rating:	Low Risk
Recommendations:	Phase 2 Intrusive investigation required to assess the potential environmental risks, and to obtain geotechnical data for foundation design.

1.0 INTRODUCTION

1.1 Assignment and Scope of Work

On the instructions of Future Investments UK Ltd a Phase 1 Desk Study / Preliminary Risk Assessment report has been prepared by SEP Technical for the proposed redevelopment of land adjacent to Hale View Road, Huyton for the construction of two detached properties and associated car parking.

This report includes a review of existing geo-environmental information together with a study of former potentially contaminative land uses to allow the production of a Conceptual Site Model and Preliminary Risk Assessment in relation to the land and its proposed redevelopment.

2.0 METHODOLOGY

This has been achieved by a detailed study of available information on:

- Soil and groundwater conditions within the general area of the site.
- Possible ground related geotechnical and contamination hazards within the site boundaries that may affect the proposed development.

The report also provides preliminary development recommendations and advice on further works required for a cost-effective reduction of risks to the development and procedures likely to satisfy regulators.

Whilst every effort has been made to pre-empt the likely requirements of the Local Authority and the Environment Agency, they are likely to have specific requirements that will need to be discussed at a later date.

The report has been compiled with reference to the following guidance:

- Land contamination: risk management published by the Environment Agency October 2020.
- ISO 21365:2019 "Soil quality – Conceptual site model for potentially contaminated sites".

It should be noted that the Planning Authority when dealing with applications involving the re-development of land that may have past history of former potentially contaminated land uses will require a series of reports as listed below:

- Phase 1 Desk Study / Preliminary Risk Assessment.
- Phase 2 Intrusive Investigation and revised Preliminary Risk Assessment.
- Phase 3 Remediation Strategy.
- Phase 4 Verification Report

2.1 Site Location

The land is situated on the South side of Hale View Road, Huyton at Grid Reference 345610, 390510.

A more detailed review of site conditions is provided in section 3.1 of this report.

2.2 Proposed Development

It is understood that it is proposed to construct two detached properties and associated car parking at the site.

3.0 SITE CHARACTERISATION

3.1 Walkover Survey

This was carried out on the 11th March 2022.

The site occupies a sensibly level area with some rough scrub and nearby bushes / trees.

Significant factors identified at this stage

As the land is within a predominantly urban setting it is probable that there is likely to be a surface veneer of made ground which must be considered to be potentially contaminated unless / until proved otherwise.

3.2 Historical Summary

In order to establish a history of land uses at and adjacent to the site an Envirocheck Report was obtained from the Landmark Information Group dated 8th March 2022.

This report includes a full set of historical plans of the area from 1892 to the present day at various scales and a summary of this information is presented on the following table.

It should be noted that the historical maps do not provide a comprehensive site history but only a series of snapshots in time and that between map dates there could have been transient land uses which have not been recorded.

In addition, not all of the uses are recorded on the maps for example small unmarked buildings.

Anecdotal information can often be a source of useful detail and if more specific particulars are needed, reference may be made to relevant trade directories.

MAP	SCALE	THE SITE	ADJACENT AREAS
Lancashire and Furness Published 1892	1:2500	The site is shown as open land with a mineral railway line crossing through it parallel with Hale View Road.	Townfield Cottages are shown immediately to the North of the site. Surrounding areas comprise open land with a "Ironworks" shown to the south of the site.
Lancashire and Furness Published 1907	1:2500	No significant changes.	No significant changes other than an "Electric Lamp Works" appears close to the east of the site.
Lancashire and Furness Published 1927	1:2500	No significant changes	No significant changes other than the "Ironworks" appears to have been demolished and what appears to be

			a "Pond" feature appears to the south of the site
Lancashire and Furness Published 1938	1:10560	No significant changes	No significant changes
Ordnance Survey Published 1957	1:1250	No significant changes	No significant change other than the Townfield Cottages have been demolished and the "Electric Lamp Company" is now labelled BICC and the "Ironworks" area is now labelled "Central Saw Mills"
Ordnance Survey Published 1964 - 1977	1:1250	No significant change other than the Mineral railway line appears to have been removed after 1967	No significant changes
Ordnance Survey Published 1970	1:2500	No significant changes	No significant change other than the "Centra Saw Mill" is now labelled "UDC Depot"
Additional SIMS Published 1980 - 1988	1:1250	No significant changes	No significant changes other than some houses have now been built to the North of the site in the area once occupied by "Townfield Cottages"
Large Scale National Grid Data Published 1993	1:1250	No significant changes	No significant changes
Present Day		No significant changes	No significant changes

In summary, It appears that the proposed development site has never been occupied other than in the early years when a Mineral Railway Line ran through the site.

As a consequence, the site is likely to be only underlain by a mantle of disturbed and / or made ground.

Significant factors identified on historical plans

Possible surface veneer of disturbed and / or made ground.

3.3 Geology and Anticipated Ground Conditions

Based on information published by the British Geological Survey the site is underlain by rocks of the Pennine Lower Coal Measures Formation of Carboniferous age.

Superficial drift deposits are indicated to be Glacial Till of Devensian origin of the Quaternary Period.

From borehole records undertaken during a previous investigation of the site in June 2012, the findings proved that the site was initially underlain by a veneer of ash type made ground up to approximately 1.50m thick, underlain by either further deposits of made ground principally comprising of clay fill and / or natural superficial deposits.

Bedrock was encountered at between 3.00m and 4.00m below existing ground level.

It was also noted that a stratum of peat up to 0.50m thick was overlying the bedrock.

Significant factors identified from geological data
The choice of foundation type would appear to be principally governed by the thickness of any made ground, the presence of any superficial deposits and the depth to bedrock at the site.

3.4 Ground Stability

The site is underlain by rocks of the Coal Measures and the interactive maps by the Coal Authority show that the site is within a Development High Risk Area, Surface Coal Reserves and Probable Shallow Coal Workings.

As the land was apparently shown as at risk from shallow mining, two deep boreholes were sunk at the site using rotary open hole drilling techniques in June 2012.

Bedrock was encountered at approximately 5.00m depth with solid rock noted to the full depth of the boreholes without any traces of coal or intact coal seams.

In addition, during drilling operations there were no indications of voiding / partial collapse such as loss of flush, dropping of drill rods or speed penetration.

On this basis it was evident that the site was not underlain by shallow coal mining and therefore posed no threat to the development from surface stability in the future.

Significant ground stability risks
No risk envisaged.

3.5 Hydrology

The nearest significant surface water features is noted to be a distance in excess of 300m from the site and hence has no impact on the development.

On this basis, the Environment Agency have no records of:

- Discharge consents.
- Pollution incidents.
- Licensed abstractions.

with respect to surface water in close proximity to the site.

In terms of flood risk, the area of the site has been classified as not affected from flooding from rivers or seas, but is designated as potentially affected from flooding to occur at surface.

The site is shown as of limited potential for groundwater flooding to occur.

Significant factors from hydrological / flood risk factors

Limited potential for surface water and groundwater flooding.
--

3.6 Hydrogeology

The overall hydrogeology of the site and the general area is shown on a series of maps provided by the Environment Agency which indicate:

- Bedrock is classified as a “Secondary Aquifer - A”.
- Superficial deposits are designated as Secondary (Undifferentiated).
- In overall terms groundwater vulnerability is classified as “Low”.

In theory it could be argued that if the land was underlain by significantly contaminated made ground, then leaching could potentially affect the quality of groundwater.

However, at this stage there is not any indication that the ground beneath the site should be affected by significant ground contamination and in this situation any potential leaching should be restricted severely thereby resulting in only negligible effects on the quality of groundwater in the underlying aquifer.

Furthermore, there are no licensed groundwater abstractions or pollution incidents to affect the quality of groundwater in the vicinity of the site.

Significant factors from hydrogeological data
--

Negligible risk to the quality of groundwater.

3.7 Hazardous Ground Gases

Radon is a gas formed by the radioactive decay of small amounts of uranium that occur naturally in all soils and rocks.

However, significant volumes of this gas are only produced in areas underlain by particular rock types not present in this area.

As a consequence, the site is not classified as in an area requiring protection against radon and any new buildings will not require the inclusion of any specific protective measures.

Other harmful gases may occur due to anthropogenic activities such as disposing of biodegradable wastes by landfilling.

Methane and carbon dioxide, which are potentially explosive and an asphyxiant respectively, are generated due to the biodegradation of such wastes and in certain conditions can migrate laterally to affect land well beyond the actual landfill itself.

In this particular case there are recorded historic landfill sites or backfilled mineral workings within close proximity to the site, although it has been noted that there was a former opencast coal working within the area but not around influencing distance.

In addition, it is considered highly unlikely that any made ground at the site includes biodegradable materials capable of forming an on site source of hazardous gases.

Significant risks identified
Potential risks envisaged at this stage

3.8 Unexploded Ordnance

A Preliminary Unexploded Ordnance (UXO) Threat Assessment report has not been obtained at this stage.

Significant risks from UXO
A report could be obtained if considered necessary at this site

3.9 Other

The following topics have not been researched at this stage

- Archaeology
- Invasive Plants
- Ecology

4.0 CONCEPTUAL SITE MODEL AND PRELIMINARY RISK ASSESSMENT

Using the information gathered to allow compilation of this report and discussed in Section 3.0 above, a Conceptual Site Model has been prepared using the Source – Pathway – Receptor methodology as shown on the following table.

This methodology applies to potential contaminants in all three phases namely solid, liquid or gaseous.

As a starting point, there must be an identifiable SOURCE of contamination which:

- In its solid form could cause problems to human health.
- If subject to leaching could potentially result in contaminated groundwater.
- If containing a proportion of biodegradable materials could result in the production of hazardous gases.

On the assumption that a source has been identified there must be a credible PATHWAY for the contamination to affect any designated RECEPTOR.

In this case the following potential pathways and receptors have been identified:

- Construction workers could be exposed to potentially contaminated made ground by dermal contact, inhalation, or ingestion.
- Contaminants within the made ground could be mobilised by leaching and potentially affect the quality of both surface and underground waters.
- If any hazardous gases are present in the ground these would need appropriate control in the construction of any new buildings with the incorporation of precautionary measures to protect site users from possible explosions and / or asphyxiation,

For there to be an identifiable risk then there must be clear linkage between each part of the chain otherwise there is no risk.

In terms of the potential ground contaminants that may affect a site, these include a common range of substances including metals, phenol, cyanide, pH, water soluble sulphate and polycyclic aromatic hydrocarbons.

In this particular case it can be assumed that any made ground may contain asbestos.

SOURCE	PATHWAY	RECEPTOR	RISK ASSESSMENT	LINKAGE
Contaminants in made ground including metals, PAHs and asbestos	Ingestion / dermal contact / inhalation	Current site users	As significant ground contamination is not anticipated at the site it is considered there are no potential high risks to current users.	Not Viable
		Construction workers	At this stage it must be assumed that the made ground at the site is contaminated thereby posing potential risks.	Viable
		Site users after re-development	Attention must be paid to the possible cover of garden areas if any made ground is shown to be contaminated.	Viable
		Adjacent Land users	Assuming appropriate practices such as wheel washing of vehicles in / off site and dust control are taken any significant risks are considered to be minimal.	Not viable
	Uptake in root zone	Plants	Attention must be paid to the possible cover of garden areas if any made ground is shown to be contaminated.	Viable
Mobile contaminants in made ground including metals and PAHs	Leaching from made ground	Groundwater	Despite the possible presence of some potentially contaminated made ground at the site and the presence of a secondary aquifer at depth the overall risk to the quality of groundwater is considered to be low at this stage.	Not viable
	Off-site migration in groundwater	Surface Water	No nearby adjacent surface water courses	Not viable

Hazardous vapours from volatile contaminants	Inhalation of vapours	Current site users	No reason to anticipate any problems from this source	Not viable
		Construction workers		
		Site Users after re-development		
		Adjacent users		
Landfill gases from the made ground	Emissions from the ground collecting in excavations / confined spaces on / off site.	Current site users	No reason to anticipate any problems from this source	Not viable
		Construction workers		
		Site Users after re-development		
		Adjacent land users		
Radon	Emissions from the ground	Construction workers	The site is in an area where no specific radon protective measures are required in the construction of new buildings.	Not viable
		Site users after re-development		
Ground conditions aggressive to buried concrete	Direct contact	Underground structures	Buried concrete will need appropriate protection from aggressive ground conditions	Viable
Ground instability	Differential settlements	Structures	Shallow mining not anticipated	Not viable.

From a study of the Conceptual Site Model it appears that the principal risks that need to be addressed relate to:

- Potential risk to site construction workers if contaminated made ground is identified at the site.
- Possible cover required to garden areas.
- Aggressive ground conditions with respect to buried concrete at the site.

5.0 FURTHER INVESTIGATION

A Phase 2 Intrusive Investigation will be required to gather information on:

- The degree of contamination of any made ground and / or topsoil.
- Geotechnical properties of the underlying superficial deposits.

It is anticipated that this will be achieved by sinking a number of window sampler boreholes across the site with appropriate in-situ testing and soil sampling to ensure sufficient information is obtained for foundation design.

Gas / groundwater wells are required as it is recorded that historical landfill sites are close to the site, although information from the 2012 investigation indicated no detectable gas flow

or differential pressure, with only traces of methane and carbon dioxide levels up to a maximum of 10%.

It is suggested that Gas / Groundwater wells are installed and monitored to confirm the above or otherwise.

Due to the works undertaken in 2012, it is noted that no shallow mining was present at the site and therefore no further works on the aspect of the investigation is required

6.0 SUMMARY AND RECOMMENDATIONS

The Phase 1 study has established that the land has always been recorded as open land with the exception that in the early years a mineral railway line crossed the site running parallel with Hale View Road, Huyton.

A Phase 2 Investigation Ground Investigation will be required to produce a revised risk assessment as appropriate, and information on foundation design.

As noted previously a Phase 3 Remediation Strategy and Phase 4 Verification Report will be produced at the appropriate time.

Lancashire And Furness

Published 1894

Source map scale - 1:10,560

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas; these maps were used to update the 1:10,560 maps. The published date given therefore is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas. In the late 1940's, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially overprinted with the National Grid. In 1970, the first 1:10,000 maps were produced using the Transverse Mercator Projection. The revision process continued until recently, with new editions appearing every 10 years or so for urban areas.

LANDMARK INFORMATION GROUP®

Liverpool

Published 1974

Source map scale - 1:10,000

These maps were produced by the Russian military during the Cold War between 1950 and 1997, and cover 103 towns and cities throughout the U.K. The maps are produced at 1:25,000, 1:10,000 and 1:5,000 scale, and show detailed land use, with colour-coded areas for development, green areas, and non-developed areas. Buildings are coloured black and important building uses (such as hospitals, post offices, factories etc.) are numbered, with a numbered key describing their use.

They were produced by the Russians for the benefit of navigation, as well as strategic military sites and transport hubs, for use if they were to have invaded the U.K. The detailed information provided indicates that the areas were surveyed using land-based personnel, on the ground, in the cities that are mapped.

VectorMap Local

Published 2021

Source map scale - 1:10,000

VectorMap Local (Raster) is Ordnance Survey's highest detailed 'backdrop' mapping product. These maps are produced from OS's VectorMap Local, a simple vector dataset at a nominal scale of 1:10,000, covering the whole of Great Britain, that has been designed for creating graphical mapping. OS VectorMap Local is derived from large-scale information surveyed at 1:1250 scale (covering major towns and cities), 1:2500 scale (smaller towns, villages and developed rural areas), and 1:10 000 scale (mountain, moorland and river estuary areas).

Lancashire And Furness

Published 1892

Source map scale - 1:2,500

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas and by 1896 it covered the whole of what were considered to be the cultivated parts of Great Britain. The published date given below is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas.

Map Name(s) and Date(s)

107_10 1892 1:2,500	107_11 1892 1:2,500
107_14 1892 1:2,500	107_15 1892 1:2,500

Large-Scale National Grid Data

Published 1993

Source map scale - 1:1,250

'Large Scale National Grid Data' superseded SIM cards (Ordnance Survey's 'Survey of Information on Microfilm') in 1992, and continued to be produced until 1999. These maps were the fore-runners of digital mapping and so provide detailed information on houses and roads, but tend to show less topographic features such as vegetation. These maps were produced at both 1:2,500 and 1:1,250 scales.

Introduction

The Environment Act 1995 has made site sensitivity a key issue, as the legislation pays as much attention to the pathways by which contamination could spread, and to the vulnerable targets of contamination, as it does the potential sources of contamination. For this reason, Landmark's Site Sensitivity maps and Datasheet(s) place great emphasis on statutory data provided by the Environment Agency/Natural Resources Wales and the Scottish Environment Protection Agency; it also incorporates data from Natural England (and the Scottish and Welsh equivalents) and Local Authorities; and highlights hydrogeological features required by environmental and geotechnical consultants. It does not include any information concerning past uses of land. The datasheet is produced by querying the Landmark database to a distance defined by the client from a site boundary provided by the client. In this datasheet the National Grid References (NGRs) are rounded to the nearest 10m in accordance with Landmark's agreements with a number of Data Suppliers.

Index Map

For ease of identification, your site and buffer have been split into Slices, Segments and Quadrants. These are illustrated on the Index Map opposite and explained further below.

Slice
Each slice represents a 1:10,000 plot area (2.7km x 2.7km) for your site and buffer. A large site and buffer may be made up of several slices (represented by a red outline), that are referenced by letters of the alphabet, starting from the bottom left corner of the slice "grid". This grid does not relate to National Grid lines but is designed to give best fit over the site and buffer.

Segment
A segment represents a 1:2,500 plot area. Segments that have plot files associated with them are shown in dark green, others in light blue. These are numbered from the bottom left hand corner within each slice.

Quadrant
A quadrant is a quarter of a segment. These are labelled as NW, NE, SW, SE and are referenced in the datasheet to allow features to be quickly located on plots. Therefore a feature that has a quadrant reference of A7NW will be in Slice A, Segment 7 and the NW Quadrant.

1.0 INTRODUCTION

On the instructions of SEP (Site Engineering Personnel) Limited a Coal Mining Risk Assessment report has been prepared by Geo-Ventures (UK) Limited for the proposed development of land at Haleview Road, Huyton.

The purpose of this report is to assess the legacy of past underground coal mining activity in the area and its impact on the proposed development of the site.

2.0 BACKGROUND

Both a Phase 1 Desk Study / Preliminary Risk Assessment report and a Phase 2 intrusive investigation and report was carried out by Geo-Ventures (UK) Limited in 2012.

The proposed development of the land did not proceed at that time but a new scheme for residential housing is now under consideration.

It has been advised that all of the information gathered by Geo-Ventures (UK) Limited in 2012 is the property of the client for the scheme and as such has been used in the compilation of this report.

3.0 OBJECTIVE AND SCOPE OF WORK

The principal objective of this desk study based risk assessment is to investigate the potential for any historical coalmining at the site and related issues with particular respect to any unrecorded workings at shallow depth and associated mine entries and to determine the geotechnical constraints these may pose to the proposed development.

If historical coal workings or any other issues associated with coalmining legacy are identified at the site and it is determined that they pose a plausible risk to the proposed development then this assessment will provide recommendations if any remedial works are considered necessary and result in the land being suitable for its proposed end use.

The report will also include details of any future intrusive investigation works considered necessary.

This assessment has utilised the following data:

- The information in the Phase 1 and Phase 2 reports prepared by Geo-Ventures (UK) Limited in 2012.
- A Coal Authority Mining Report for the site dated 6th August 2012.

4.0 THE SITE

This is located at the eastern end of Hale View Road, Huyton and is a small parcel of sensibly level land.

5.0 THE PROPOSAL

It is understood that it is proposed to construct residential housing with associated carparking on the land.

6.0 SOURCES OF INFORMATION

6.1 Historical Records

As noted in the Phase 1 report, the old plans of the general area indicate a history of past mining activities, with reference to both former collieries and opencast mining sites.

However, neither of these features impinge on the site itself.

6.2 Geology

From information published by the British Geological Survey the site and its adjacent areas are underlain by rocks of the Westphalian of Carboniferous age which include an interbedded succession of sandstones, siltstones and mudstones with subordinate coal seams.

These solid rocks have a covering of recent superficial drift deposits principally comprising glacial till.

6.3 Mining Records

In the report from the Coal Authority it is evident that the site has been directly undermined or is within influencing distance of workings in one seam of coal at 420m depth and last worked in 1883.

Any ground movement from these coal workings should have stopped by now.

However, the report notes that the Coal Authority believe the site is in an area where coal is present at or close to the surface which may have been worked at some time in the past.

In addition, there are no known mine entries within or directly adjacent to the site, no records of mine gas emissions requiring action by the Authority or instances of subsidence damage.

With respect to opencast mining the site is not within 200m of any past or current extraction activities.

7.0 RISK ASSESSMENT

This follows the protocol as outlined in the document “Requirements of a Coal Mining Risk Assessment report” published by the Coal Authority.

The assessment considers the likelihood or probability of a particular event taking place in conjunction with its potential consequence or impact as shown on the matrix below based on that outlined in CIRIA report C552.

		Consequence (Impact)			
		Severe	Medium	Mild	Minor
Probability (Likelihood)	High Likelihood	Very High Risk	High Risk	Moderate Risk	Moderate/Low Risk
	Likely	High Risk	Moderate Risk	Moderate/Low Risk	Low Risk
	Low Likelihood	Moderate Risk	Moderate/Low Risk	Low Risk	Negligible Risk
	Unlikely	Moderate/Low Risk	Low Risk	Negligible Risk	Negligible Risk

7.1 Deep Coalmining

Due to the limited extent, depth and date of past deep mining, the overall risk of any future ground movements is considered to be NEGLIGIBLE.

7.2 Shallow Coalmining

This term is usually taken to refer to any workings above 30m depth

In order to check that the site is not underlain by any unrecorded shallow workings, two rotary open holes were sunk to a depth of 30.00m into bedrock beneath the site.

Neither of these boreholes recorded the presence of any coal or indications of old shallow workings such as loss of flush, increased rates of penetration or abrupt changes in groundwater conditions.

On this basis it is considered reasonable to assume that any risks due to past shallow mining are NEGLIGIBLE.

7.3 Mine Entries

There are no records held by the Coal Authority of any abandoned mine entries within the site boundary.

However, it could be argued that if the site had been shown to be here may be old affected by shallow unrecorded workings, there could have been previously unknown mine entries beneath the site, but as the possibility of old shallow workings has been discounted the presence of old shafts can equally be ruled out.

As a consequence any risks are judged to be NEGLIGIBLE.

7.4 Open Cast Mining

Although the site is within the general area where opencast activity has taken place in the past, these have not affected the site itself.

Any risks are therefore classified as NEGLIGIBLE.

7.5 Mine Gas

The Coal Authority hold no records of any previous emissions of mine gas.

This is not surprising as the only past deep mining activity was at considerable depth and intrusive investigation work has not shown any evidence of any former unrecorded shallow workings.

As a consequence any risks associated with the presence of mine gases are considered to be NEGLIGIBLE.

7.6 Overview

As may be seen from the above individual risk assessments, all are judged to be NEGLIGIBLE.

8.0 SUMMARY

Despite the fact that the site is within a general area where past mining activities have taken place, the land itself has not been affected and any specific risks are considered to be NEGLIGIBLE.

It should be noted that any comments in this report are advisory only and all design decisions remain the responsibility of others.

APPENDIX C PROPOSED DEVELOPMENT PLAN

APPENDIX D GENERAL REPORTING CONDITIONS

The sole purpose of this report and the associated services performed by SEP Technical is to undertake a Phase 1 Desk Study / Preliminary Risk Assessment for land at Hale View Road, Huyton in accordance with the scope of services set out in the agreement between SEP Technical and the Client.

In preparing this report, SEP Technical has relied upon, and presumed accurate, any information (or confirmation of the absence thereof) provided by the Client. Except as otherwise stated in the report, SEP Technical has not attempted to verify the accuracy or completeness of any such information. If the information is subsequently determined to be false, inaccurate or incomplete then it is possible that our observations and conclusions as expressed in this report may change.

The opinions contained within this report have been derived by the finite data on which they are based and are relevant only to the purpose for which the report was commissioned.

SEP Technical derived the data in this report from information sourced from the Client and available in the public domain at the time or times outlined in this report. The passage of time, manifestation of latent conditions or impacts of future events may require further examination of the risk assessment, findings, observations and conclusions expressed in this report. SEP Technical has prepared this report in accordance with the usual care and thoroughness of the consulting profession, for the sole purpose described above and by reference to applicable standards, guidelines, procedures and practices at the date of issue of this report. For the reasons outlined above, however, no other warranty or guarantee, whether expressed or implied, is made as to the assessment, observations and findings expressed in this report, to the extent permitted by law.

This report should be read in full and no excerpts are to be taken as representative of the findings. No responsibility is accepted by SEP Technical for use of any part of this report in any other context.

The report should not be considered to be exhaustive, and any opinions only relate to the purpose for which the report was commissioned.

It should be noted any risks identified in this Phase 1 Report are and must be regarded as perceived risks and based purely on the information reviewed, and it must also be noted that the actual risks at the site can only be assigned after the completion of the Phase 2 Intrusive Investigation report has been completed

This report has been prepared on behalf of, and for the exclusive use of the Client, and is subject to, and issued in accordance with, the provisions of the agreement between SEP Technical and the Client.

SEP Technical accepts no liability or responsibility whatsoever for, or in respect of, any use of, or reliance upon, this report by any third party.

SEP TECHNICAL

Part of the  SEP group of companies

SEP ENGINEERS

Providing engineers and expert setting out, quality assurance and as-built survey services since 1986.

 01695 729835

SEP GEOSPATIAL

Specialists in the sale, hire and service of industry-standard surveying and engineering equipment.
