EXECUTIVE SUMMARY

A Preliminary Ecological Appraisal has been carried out at the land off Netherley Road, Tarbock Green on 3rd May 2022 by Lizzie Atkinson. The assessment comprised a desk study and biological records search, as well as a site walkover survey in order to map habitat types. The survey was extended to assess the potential for protected species to use the site. The assessment provides baseline data as to current site conditions and where appropriate allows recommendations to be made in respect of further potential work in order to satisfy current wildlife legislation.

A dusk emergence survey was carried out at buildings B1, B2, B3 and B4 on 5th September 2022 by Lizzie Atkinson (Lead Surveyor), Evie Berry, Lauren Hadford, Amy Swindells, John Lindsay and Hannah Pimpen. **During the survey four common pipistrelle bats were recorded to emerge from building B2.** No bats were identified to emerge building B1, B3 and B4. A moderate level of activity was recorded with common pipistrelle, soprano pipistrelle and noctule foraging and commuting activity recorded within the site.

A dawn re-entry survey was carried out at buildings B1, B2, B3 and B4 on 22nd September 2022 by Liz Kenyon (Lead surveyor), Lauren Hadford, Niall Doherty, Hannah Pimpen, Darnell Shaw and John Lindsay. No bats were identified to re-enter buildings B1, B2, B3 and B4 and a low level of bat activity was recorded with common pipistrelle, soprano pipistrelle and noctule foraging and commuting activity recorded throughout the survey.

An updated dusk emergence survey was carried out on buildings B1, B2, B3 and B4 on 3rd May 2023 by Lizzie Atkinson (Lead surveyor), Jack Kay, Amy Swindells, Evie Berry, Jordan Thomas and Dan Charters. **During the survey a single common pipistrelle bat was recorded to emerge from building B2.** A moderate level of activity was recorded with common pipistrelle, soprano pipistrelle and noctule foraging and commuting activity recorded within the site. No bats were identified to emerge buildings B1, B3 and B4.

A dawn re-entry survey was carried out of buildings B1, B2, B3 and B4 on 9th June 2023 by Lizzie Atkinson (Lead surveyor), Amy Swindells, Shona Bancroft, Harriet Cox and Niall Doherty. During the survey, a very low level of activity was recorded with common pipistrelle and noctule foraging and commuting recorded within the site. No bats were identified re-entering buildings B1, B2, B3 and B4.

The nocturnal bat surveys are detailed within the report *Ascerta P.1712.22A Bat Nocturnal Surveys, Netherley Road, Rev A* which should be read in conjunction with this report.

The site was visited on 3rd May 2023 by Lizzie Atkinson and Liz Kenyon to carry out a Habitat Suitability Index (HSI) for Great Crested Newt (GCN) of the two offsite ponds within 250m of the site.

Assessed against the 'Guidelines for Ecological Impact Assessment in the UK and Ireland' 2nd edition (2018), the habitats range in ecological value from negligible to within the zone of influence of the site. The majority of habitats are likely to be lost to the proposals. As the habitats to be lost to the proposals are small in area and not of high ecological value it is considered that their loss can be mitigated for and the proposals will not adversely affect the ecological value of the wider area, provided the recommendations detailed below are followed.

Bat surveys are conducted in accordance with the Bat Surveys for Professional Ecologists - Good Practice Guidelines, published 2016 (the Guidelines) and Interim Guidance Note, May 2022. Strict adherence to these is not necessary, but where practice deviates from them, clear reasons and rationale are required.

The site comprises a portable building manufacturer with large, interconnected warehouses and associated offices (B1-B4) that are surrounded by hardstanding. Pockets of scrub are present throughout the site and tall ruderal vegetation has encroached much of the hardstanding. Scattered trees line the eastern and southern site boundary and self-seeded scattered saplings are present throughout.

If the recommendations below are followed these species will not be adversely affected by the proposals.

- An application to Natural England will need to be made with regards to acquiring a European Protected Species licence in order that the bat roost can be destroyed in the appropriate manner at building B2;
- If works are not begun by June 2024, a preliminary bat roost assessment of all trees to be removed or pruned to accommodate proposals will be required to inform further recommendations if required;
- Production of a Bat Mitigation Measures report to be produced and implemented to ensure there is no loss of roosting provision or harm to bats during the works;
- Soft demolition of buildings B1 and B3 under ecological supervision and a Tool Box Talk to be given to all contractors;
- Production and implementation of a Construction Environmental Management Plan (CEMP) to protect Brick Wall Covert Local Wildlife Site (LWS) that lies adjacent to the western site boundary during works;
- Sensitive lighting to be used to meet the Bat Conservation Trust lighting guidance so not to cause a detrimental effect to light sensitive species;
- Production and implementation of an amphibian RAMS to avoid any harm to this species during the proposed works;
- Implementation of a badger and hedgehog RAMS (section 5.2) to avoid any harm to this species during the proposed works;
- Vegetation clearance, pruning and building works should be undertaken outside of the nesting bird season (1st March to 31st August Inclusive) to avoid any impact on breeding birds. Or a nesting bird check undertaken by a suitably experienced ecologist should be undertaken immediately prior to works commencing;
- Provision of planting that is favourable for red squirrel to provide areas of refuge and to enhance connectivity to the surrounding landscape (section 5.3);
- Retain and enhance site boundaries through appropriate landscape planting that includes native, species rich hedgerows, trees and areas of wildflowers plus provision of integrated bat and bird features within newly constructed buildings;
- Production of the Defra Metric Biodiversity Net Gain Calculations to minimise impacts on biodiversity and provide net gains in biodiversity; and
- Production of a Management Plan to ensure the long-term commitments to manage the planting, protection and enhancement of biodiversity in and around a new development site.

The site provides habitat for nesting birds, badger, hedgehog, amphibians and bats. Habitats on site will be lost to the proposals. There is likely to be low impacts on the local ecology due to the proposals if the recommendations within section 6 are implemented.

1.0 Introduction

Ascerta has been instructed by GDB Property Investments Ltd to carry out a Preliminary Ecological Appraisal of the land at Netherley Road, Tarbock Green (hereafter referred to as the site). The site OS grid reference is SJ 462 876 and the What3Words reference is manliness.focus.drum The extent of the site is displayed in photograph 1.1 below.

Photograph 1.1: Extent of site

The site was visited on 3rd May 2022 by Lizzie Atkinson when a Preliminary Ecological Appraisal, which includes an assessment of the potential for protected species to be using the site or surroundings, was carried out in accordance with the *Handbook for Phase 1 Habitat Survey: a Technique for Environmental Audit* (JNCC, 2010). The report was prepared following methods detailed in the CIEEM 'Guidelines for Ecological Impact Assessment in the UK and Ireland' (2018) and 'Guidelines for Ecological Report Writing' (2017). This report presents the results of the survey including evaluation of habitats on site and potential for protected species to be using the site. The report includes recommendations for further actions where applicable in order to satisfy current wildlife legislation and to achieve our client's objectives. Relevant legislation is detailed within Appendix 4.

A dusk emergence survey was carried out at buildings B1, B2, B3 and B4 on 5th September 2022 by Lizzie Atkinson (Lead Surveyor), Evie Berry, Lauren Hadford, Amy Swindells, John Lindsay and Hannah Pimpen. **During the survey four common pipistrelle bats were recorded to emerge from building B2.** No bats were identified to emerge building B1, B3 and B4. A moderate level of activity was recorded with common pipistrelle, soprano pipistrelle and noctule foraging and commuting activity recorded within the site.

A dawn re-entry survey was carried out at buildings B1, B2, B3 and B4 on 22nd September 2022 by Liz Kenyon (Lead surveyor), Lauren Hadford, Niall Doherty, Hannah Pimpen, Darnell Shaw and John Lindsay. No bats were identified to re-enter buildings B1, B2, B3 and B4 and a low level of bat activity was recorded with common pipistrelle, soprano pipistrelle and noctule foraging and commuting activity recorded throughout the survey.

An updated dusk emergence survey was carried out on buildings B1, B2, B3 and B4 on 3rd May 2023 by Lizzie Atkinson (Lead surveyor), Jack Kay, Amy Swindells, Evie Berry, Jordan Thomas and Dan Charters. **During the survey, a single common pipistrelle bat was recorded to emerge from building B2.** A moderate level of activity was recorded with common pipistrelle, soprano pipistrelle and noctule foraging and commuting activity recorded within the site. No bats were identified to emerge building B1, B3 and B4.

A dawn re-entry survey was carried out of buildings B1, B2, B3 and B4 on 9th June 2023 by Lizzie Atkinson (Lead surveyor), Amy Swindells, Shona Bancroft, Harriet Cox and Niall Doherty. During the survey, a very low level of activity was recorded with common pipistrelle and noctule foraging and commuting recorded within the site. No bats were identified re-entering buildings B1, B2, B3 and B4.

The nocturnal bat surveys are detailed within the report *Ascerta P.1712.22A Bat Nocturnal Surveys, Netherley Road, Rev A* which should be read in conjunction with this report.

The site was visited on 3rd May 2023 by Lizzie Atkinson and Liz Kenyon to carry out a Habitat Suitability Index (HSI) for Great Crested Newt (GCN) of the two offsite ponds within 250m of the site.

The site comprises a portable building manufacturer with large, interconnected warehouses and associated offices (B1-B4) that are surrounded by hardstanding. Pockets of scrub are present throughout the site and tall ruderal vegetation has encroached much of the hardstanding. Scattered trees line the eastern and southern site boundary and self-seeded scattered saplings are present throughout.

Our client seeks planning consent to redevelop the site for residential dwellings, garages within gardens and community orchard within the south of the site as well as retention of existing access road.

2.0 Objectives

Our client's objectives are to assess the potential ecological constraints of the proposed development site.

Our objectives are as follows:

- Identify and evaluate any features of ecological value and the potential of the site to support protected species based on the walkover survey and biological records search;
- Identify designated sites within 2km of the site;
- Review protected species records within 2km of the site;
- Map the habitats within the site using JNCC (2010) methods;
- Provide recommendations for further species-specific surveys and mitigation measures where current legislation requires;
- Provide recommendations that seek to enhance the ecological value of the site;
- Provide recommendations to assist our clients in achieving their objectives whilst satisfying current wildlife legislation.

3.0 Survey Methods

The Preliminary Ecological Appraisal involved the collection and review of data from a desk study and field survey along with assessment of the value of the habitats following CIEEM guidelines.

3.1 Desk Study

A review of the designated sites and habitats within 2km of the site has been undertaken in May 2022 using the Multi-Agency Geographic Information for the Countryside (MAGIC) and the Natural England websites.

A review of UK and Local priority species and habitats known to occur within 2km of the site has been undertaken in May 2022; using the Joint Nature Conservation Committee website, Multi-Agency Geographic Information for the Countryside (MAGIC) and local records from BioBank Merseyside (Appendix 5).

3.2 Field Survey

A walkover survey of the site was conducted on 3rd May 2022 by Lizzie Atkinson when the habitat types and features of ecological interest were identified and mapped in compliance with the Handbook for Phase 1 Habitat Survey: A Technique for Environmental Audit (*JNCC, 2010*). The survey methods involve the recording and mapping of all habitat types and ecological features present on site, including the identification of the main species present and examination of the potential for any protected species. Habitats were mapped and target notes made for any interesting features.

The surveys particularly focused on the following species and habitat features:

- Mammals (badgers, bats, red squirrel);
- Birds (including species potentially associated with 'European Sites');
- Amphibians and reptiles;
- Invertebrates;
- Hedgerows and boundaries;
- Invasive plant species; and
- Plant communities and trees.

Weather conditions during the survey were mild (12°C), dry and overcast (8/8 cloud cover) with a F1 (Beaufort Scale) light air, therefore appropriate for this type of survey.

3.3 Bat Survey Methods

The survey methods followed the guidelines set out by the Bat Conservation Trust Bat Surveys for Professional Ecologists Good Practice Guidelines – 3rd Edition (2016). Habitats, buildings and trees were assessed for suitability for use by bats and categorised independently using table 4.1 page 35 within the Bat Conservation Trust Guidelines (Collins, 2016).

Preliminary Ecological Appraisal for Bats

Habitats on site were assessed for their suitability for bats to use them for roosting, commuting and foraging both on the site and surrounding area. Commuting and foraging habitat suitability was categorised **low** to **high**. Commuting and foraging habitat valued as **moderate** or above may need further survey effort if lost to the proposals.

Preliminary Roost Assessment Trees

All trees were inspected for Potential Roost Features (PRFs). Features searched for included: Natural or woodpecker holes, cracks/splits in major limbs, loose bark, hollows/cavities, dense epicormic growth, bird and bat boxes. Where such features were found they were investigated for scratches or staining, bat droppings and smoothing of surfaces around entry points. Trees assigned a suitability of **moderate** or above may require further inspection if they are to be lost to the development.

External Inspection of the Building

A daytime external inspection of the buildings was carried out during the survey by a suitably experienced ecologist. The buildings were searched externally looking for signs of bats, including staining on barge boards, soffits and more commonly droppings on flat surfaces i.e. window ledges that would indicate potential roosting sites. Possible bat access points such as loose tiles, cracks and crevices or crawl spaces beneath and/or behind roofing materials such as roofing felt, panelling, soffits and tiles were identified and checked for signs of use by bats, for example droppings, scratch marks and staining.

The building was categorised as per Table 4.1 (below). Buildings assigned a suitability of **Low** or above may require further inspection if they are to be lost to the development.

Table 4.1: Guidelines for assessing Potential Roost Features (PRFs), commuting and foraging habitat within a proposed development site. Guidelines taken from table 4.1 page 35 of the Bat Conservation Trust Bat Surveys for Professional Ecologists Good Practice Guidelines – 3rd Edition (2016).

Suitability	Roosting Habitats	Commuting and Foraging Habitats
<i>Negligible</i>	<i>Negligible habitat features on site likely to be used by roosting bats.</i>	<i>Negligible habitat features on site likely to be used by commuting or foraging bats.</i>
<i>Low</i>	<i>A structure with one or more potential roost sites that could be used by individual bats opportunistically. However, these potential roost sites do not provide enough space, shelter, protection, appropriate conditions ^a and/or suitable surrounding habitat to be used on a regular basis or by larger numbers of bats (i.e. unlikely to be suitable for maternity or hibernation^b).</i> <i>A tree of sufficient size and age to contain PRFs but with none seen from the ground or features seen with only very limited roosting potential. ^c</i>	<i>Habitat that could be used by small numbers of commuting bats such as a gappy hedgerow or unvegetated stream, but isolated, i.e. not very well connected to the surrounding landscape by other habitat.</i> <i>Suitable, but isolated habitat that could be used by small numbers of foraging bats such as a lone tree (not in a parkland situation) or a patch of scrub.</i>
<i>Moderate</i>	<i>A structure or tree with one or more potential roost sites that could be used by bats due to their size, shelter, protection, conditions^a and surrounding habitat but unlikely to support a roost of high conservation status (with respect to roost type only – the assessments in this table are made irrespective of species conservation status, which is established after presence is confirmed).</i>	<i>Continuous habitat connected to the wider landscape that could be used by bats for commuting such as lines of trees and scrub or linked back gardens.</i> <i>Habitat that is connected to the wider landscape that could be used by bats for foraging such as trees, scrub, grassland or water.</i>
<i>High</i>	<i>A structure or tree with one or more potential roost sites that are obviously suitable for use by larger numbers of bats on a more regular basis and potentially for longer periods of time due to their size, shelter, protection, conditions ^a and surrounding habitat.</i>	<i>Continuous, high-quality habitat that is well connected to the wider landscape that is likely to be used regularly by commuting bats such as river valleys, streams, hedgerows, lines of trees and woodland edge.</i> <i>High-quality habitat that is well connected to the wider landscape that is likely to be used regularly by foraging bats such as broadleaved woodland, tree-lined watercourses and grazed parkland.</i> <i>Site is close to and connected to known roosts.</i>

^a For example, in terms of temperature, humidity, height above ground level, light levels or levels of disturbance.

^b Evidence from the Netherlands shows mass swarming events of common pipistrelle bats in the autumn followed by mass hibernation in a diverse range of building types in urban environments (Korsten et al., 2015). This phenomenon requires some research in the UK but ecologists should be aware of the potential for larger numbers of this species to be present during the autumn and winter in large buildings in highly urbanised environments.

^c This system of categorisation aligns with BS 8596:2015 Surveying for bats in trees and woodland (BSI,2015).

3.4 Badger Survey Methods

The site was searched for setts and badger field signs including foraging areas, latrines and tracks. Attention was paid to the presence of the following field signs:

- Setts: single holes or a series of holes likely to be interconnected underground;
- Latrines: badgers usually deposit faeces in excavated pits;
- Paths and footprints;
- Scratching posts: at the base of trees;
- Snuffle holes: areas where badgers have searched for insects;
- Day nest: bundles of vegetation where badgers may sleep above ground; and
- Traces of hair.

3.5 Great Crested Newt Habitat Suitability Index (HSI)

The two off-site ponds were assessed for suitability as great crested newt breeding habitat. The HSI assessment followed the method described by Oldham *et al.* (2000) as updated by ARG UK (2010), involving an assessment of each water body against ten suitability indices:

- Location of the pond within the context of Britain;
- Total surface area of the pond;
- Pond drying (based on both local knowledge and field evidence);
- Water quality;
- Percentage perimeter shaded;
- Presence or absence of waterfowl;
- Presence or absence of fish;
- Number of water bodies situated within 1km;
- Suitability of terrestrial habitat; and
- Percentage macrophyte cover.

The HSI is calculated using an equation producing a single number between 0 and 1. The value provides an indication of whether the water body is likely to support a population of great crested newts. The lower the Index the less likely the location is to support a breeding population. Ponds are classed as Poor, Below Average, Average, Good or Excellent habitat suitability based on this value.

3.6 Evaluation

Habitats and species on the site were evaluated following the '*Guidelines for Ecological Impact Assessment in the UK and Ireland*' 2018. A geographical frame of reference is assigned to each habitat and species, with International Value being most important, then National, Regional, County, District, Local and lastly, within the immediate Zone of Influence (Zoi) of the proposals only.

Value judgements are based on characteristics that can be used to identify ecological resources or features likely to be important in terms of biodiversity. These include site designations such as SSSIs. For undesignated features, the size, conservation status (locally, nationally or internationally), and the quality of the ecological resource are considered. Ecological resource quality can refer to habitats (for instance if they are particularly diverse, or a good example of a specific habitat type), other features (such as wildlife corridors or mosaics of habitats) or species populations or assemblages.

The recommendations detailed within this report aim to meet requirements of the Environment Act and Biodiversity Metric 4.0 as far as possible at this stage.

3.7 Limitations

The site visit was undertaken in early May. This is within the optimal time of year for phase 1 habitat surveys and sufficient vegetation was present to enable habitat identification. It is not considered a limit to the conclusions of the report based on the habitats found within the site and the works proposed.

Access to carry out an internal inspection of the building was not available. Buildings B1, B2 and B3 could partially be viewed internally through open entrances. These access restrictions are taken into account within the report conclusions.

The absence of biological records does not necessarily mean the absence of species. This has been taken into account within the report conclusions.

4.0 Survey Results

4.1 Desk Study

No statutory sites were identified within a 2km radius of the proposed development site and seventeen non-statutory sites such were identified within a 2km radius the proposed development site.

The following non-statutory sites were identified within the vicinity of the proposals (with distance and direction from the site):

- Coppice Lane Council Depot, Huyton Local Wildlife Site (LWS), 1.7km north;
- Ox Lane Wood, Tarbock LWS, 1km north;
- Ochre Brook, Tarbock LWS, 600m north;
- Dog Clog Brook LWS, 460m north;
- Mill Brook, Netherley LWS, 900m, north-west;
- Netherley Brook LWS, 920m west;
- Tributary of Netherley Brook LWS, 1.6km west;
- Cartbridge Lane Wood LWS, 1.4km south-west;
- Green's Bridge Plantation LWS, 1.2km south;
- Ditton Brook LWS, 1.6km south
- Tarbock Green Ditch LWS, 450m south-east;
- Brickwall Covert LWS, adjacent to the western site boundary;
- Daggers Bridge Wood LWS, 1.4km north-east
- Strettles Bog, Tarbock LWS, 1.45km north-east
- The Old Wood, South LWS, 1.9km north-east
- Lee Park Golf Course LWS, 1.4km west; and
- Netherley Woods and Brook LWS, 1.2km west

The full designations for each site are listed within appendix 5.

One area of ancient woodland was identified within the vicinity of the proposals (with distance and direction from the site):

- The Old Wood LWS, 1.9km north-east.

The site lies within Netherley Brook and Ditton Brook Corridor, a designated Nature Improvement Area and also lies within the Green Belt.

The site does lies within a Natural England SSSI Impact Risk Zone, however a consultation with Natural England will not be triggered as the proposals are for residential dwellings only.

Following a review of records held by the Merseyside Biobank, several priority species that have the potential to occur within the vicinity of the proposed development have been identified. These include birds, bats, badger, brown hare, red squirrel, water vole, otter, hedgehog and amphibians. The species records are summarised below, and the detailed records held by Merseyside Biobank within 2km of the site are displayed within Appendix 5.

Birds

Two hundred and forty records were returned for bird species within 2km of the site. Species present include starling, swift, song thrush, skylark, lapwing, kingfisher, corn bunting, dunnoek and barn owl. The most recent record was in April 2015 for a tree sparrow located approximately 1.3km south-west of the site within agricultural land. The closest record was in 2007 for a yellowhammer located 120m south of the site close to the Brickwall Inn.

Bats

Sixty-four records of bats were returned within 2km of the site. Fourteen records were for pipistrelle bat species, three were for soprano pipistrelle, nine were for common pipistrelle, eight record for noctule bat, six for brown long-eared bat, one for daubenton's bat, one for whiskered/brandt's bat, one for myotis species and twenty-one records for unidentified bat species. The most recent record was in July 2019 for two unidentified bat species, located 540m north-west of the site within an area of woodland. The closest records of bat were in July 2007 for common pipistrelle, pipistrelle bat and myotis bat species located 240m south-west of the site within Brewery House.

Amphibians

One hundred and ninety records of amphibians were returned within 2km of the site these records included forty-four for smooth newt, ninety-four for common frog, seventeen for great crested newt (GCN) and thirty-five for common toad. The most recent record and closest was in April 2021 for a common frog located within a pond 370m north-west of the site.

Reptiles

No records of reptiles were returned within 2km of the site.

Terrestrial mammals

Four record of badger was returned within 2km of the site. The most recent and closest record was in January 2016 for a sett located 360m north-west of the site within an area of woodland.

Forty-seven records for hedgehog were returned within 2km of the site. The closest and most recent record was in May 2019 for a field record located 130m east of the site.

Thirty-nine records of brown hare were returned within 2km of the site. The most recent record was in January 2019 for a field record located 690m north-east of the site adjacent to Knowsley Expressway. The closest record was in 2004 for a field record located 610m north-west of the site within agricultural land.

Two records of red squirrel were returned within 2km of the site. Both records were from 2008 with one field sighting located 1.2km west of the site and the other 2km west of the site.

Eighteen records of otter were returned within 2km of the site. The majority of records were from Hockenhull Plats and River Gowy, approximately 1.9km south-east of the site.

One hundred and two records of water vole were returned within 2km of the site. The most recent record was in March 2021 for a burrow located in a brook, 700m north-west of the site. The closest records were historical records in 2000 for field records located 300m south of the site within Tarbock Green Ditch, Brick Wall Inn.

No European Protected Species Licence (EPSL) applications within 2km of the site since 2016 were identified using Magic Maps.

A list of key habitats is shown in table 5.1 below and a summary description of key habitats within the site is provided in Section 5.2. Notes on the presence or potential presence of protected species are provided in Section 5.3. The Phase 1 Habitat map can be found in Appendix 1. The Target Notes (TN) and lists of species recorded during survey are presented in Appendix 2.

4.2 Habitat Survey

The site is bound by Netherley Road (B5178) to the south, Brick Wall Covert Local Wildlife Site (LWS) to the west and north with Tarbock Green Riding School to the east and the surrounding land use is predominately agricultural land. The site comprises a portable building manufacturer with large, interconnected warehouses, workshops and associated offices (B1-B4) that are surrounded by hardstanding. Pockets of scrub are present throughout the site and tall ruderal vegetation has encroached the hardstanding. Scattered trees line the eastern and southern site boundary and self-seeded scattered saplings are present throughout. These habitats are presented on plan P.1622.22.01 (Appendix 1).

The habitat types identified within the site are detailed below and are displayed on drawing P.1622.22.01 *Phase One Habitat Survey* in Appendix 1 and on Photographs within Appendix 3. Species lists and target notes are displayed in Appendix 2.

Hardstanding (J4)

The site is dominated by hardstanding (concrete and tarmac). The concrete areas form the access road, areas used for car parking and site yard. The tarmacked areas form a former carpark area to the south of the buildings. The hardstanding has been encroached with tall ruderal and scrub throughout. Stacks of pallets (TN1) and printing ink barrels (TN3) are present within the hardstanding west of the buildings. This habitat is displayed in photograph 10 within Appendix 3.

Buildings (J3.6)

Four buildings (B1-B4) are present within the portable building manufactures site. The buildings comprise interconnected warehouses, storage units and associated offices. The buildings are all currently in use. The buildings are detailed within section 4.3 below. The buildings are displayed within photographs 11-20 within Appendix 3.

Dense/continuous scrub (A2.1)

Pockets of mixed native species dense scrub is present throughout the site within the understorey of the scattered trees and has encroached areas of hardstanding. Species present include bramble, buddleja and salix sp. This habitat is displayed in photographs 8 and 9 within Appendix 3.

Scattered trees (A3.1)

Scattered trees line the eastern site boundary, and a small group are present along the southern site boundary. Self-seeded scattered saplings are present throughout the site. Species present include ash, sycamore, goat willow, Leyland cypress, oak, alder, crack willow, cherry and poplar. This habitat is displayed in photographs 2-5 within Appendix 3.

Tall ruderal (C3.1)

Tall ruderal has encroached the hardstanding throughout the site. Species present include buddleja, broadleaved dock, common nettle, ragwort, herb Robert, cleavers, willowherb and bindweed. This habitat is displayed in photographs 6-7 within Appendix 3.

4.3 Preliminary bat roost assessment of buildings

Building 1-

Building B1 is a single storey disused workshop building currently used for the storage of pallets and cardboard boxes. Building B1 is connected to building B2 on the western elevation. The building is constructed in breezeblock and brick walls with corrugated metal cladding. The exposed areas of brickwork are in good condition, areas of pointing were noted to be missing. The roof is sloped and constructed in corrugated sheets with plastic skylights present and is supported by metal beams. The cladding on the walls is misshapen in places exposing large gaps between the cladding and brickwork. A large gap was noted on the north-eastern corner of the building between the adjoining brickwork wall and corrugated metal cladding. Gaps are present between the metal facias and brickwork on the eastern elevation. A sliding wooden door that was open during inspection is present on the eastern elevation and large gaps were noted between the door and brickwork. No evidence of bats was identified during the external inspection.

The building was assessed to have **negligible** hibernation potential for crevice and void dwelling bats and **moderate** potential for day and maternity roosts for crevice dwelling bats and **low** potential for void dwelling bats. Overall, the building is classified as having **moderate** bat roosting potential.

Building 2-

Building B2 is single storey warehouse unit constructed in breezeblock and brickwork walls with corrugated metal cladding. Building B2 is connected to buildings B1 and B3. The exposed brickwork on the eastern elevation has large cracks and areas of missing pointing. Gaps were also identified between the cladding and the brickwork. The roof is pitched and constructed in corrugated sheets with metal facias with plastic skylights. Areas of facias are missing, and gaps are present between the facias and the brickwork. A large entrance with a metal roller shutter than was closed during inspection is present off the eastern elevation and gaps were noted between the shutter and brickwork. A second entrance is present off the western elevation and was open during inspection. A single storey extension is present off the western elevation. The extension is constructed in breeze block walls with a corrugated metal roof with wooden facias. Gaps were noted between the facias and walls. No evidence of bats was identified during the external inspection.

The building was assessed to have **negligible** hibernation potential for crevice and void dwelling bats and **moderate** potential for day and maternity roosts for crevice dwelling bats and **low** potential for void dwelling bats. Overall, the building is classified as having **moderate** bat roosting potential.

Building 3-

Building B3 is single storey warehouse unit constructed in brickwork walls with corrugated metal cladding on the western elevation. Building B3 is connected to buildings B2 and B4. The roof is pitched and constructed in corrugated metal sheets with plastic skylights present. The exposed brickwork on the eastern elevation is in good condition. The fascias are metal and small gaps were identified between the walls and fascias. A large entrance with a metal roller shutter that was closed during inspection is present off the eastern elevation and small gaps were noted between the shutter and brickwork. A second entrance is present off the western elevation and was open during inspection. A single storey extension storage shed is present off the western elevation. The extension is constructed in breeze block walls with a corrugated metal roof with metal fascias. Gaps were noted between the fascias and walls as well as between the roof and walls. No evidence of bats was identified during the external inspection.

The building was assessed to have **negligible** hibernation potential for crevice and void dwelling bats and **moderate** potential for day and maternity roosts for crevice dwelling bats and **low** potential for void dwelling bats. Overall, the building is classified as having **moderate** bat roosting potential.

Building 4-

Building B4 is a two-storey office block building. Building B4 is constructed in brickwork walls with a flat concrete roof. The brickwork is intact but has large areas of missing pointing. The fascias and soffit boards are wooden, and gaps are present between the soffit boards and fascias. The windows are single glazed within wooden painted frames and the paint was noted to be peeling. Windows on the eastern and southern elevation were open during inspection and a window on the western elevation was noted to be boarded up. The main entrance with closed metal shutters sits within the southern elevation and small gaps were noted between the shutter frame and walls. No evidence of bats was identified during the external inspection.

The building was assessed to have **negligible** hibernation potential for crevice and void dwelling bats and **moderate** potential for day and maternity roosts for crevice dwelling bats and **low** potential for void dwelling bats. Overall, the building is classified as having **moderate** bat roosting potential.

4.4 Great Crested Newt Habitat Suitability Index Assessment (GCN HSI)

Table 4.1: Standing Water Description and GCN HSI with full details in Appendix 6.

Standing water description	Photograph
Pond 1: is located 80m north-east of the site. The pond is ephemeral, holding approximately <5cm water deep. The pond has limited aquatic vegetation present within the pond and is surrounded by semi-improved grassland that had been heavily poached by horses. The HSI score was 0.43 meaning it has Poor suitability for use by great crested newt for breeding.	
Pond 2: is located 250m north-west of the site within Brick Wall Covert LWS. The pond is ephemeral and holding water approximately <5cm deep with no aquatic vegetation present and large amounts of leaf litter within the pond and surrounding. The HSI score was 0.42 meaning it has Poor suitability for use by great crested newt for breeding.	

4.5 Protected and Notable Species

Birds

The habitats within the site provide suitable foraging and nesting opportunities for bird species. These habitats include tall ruderal, scrub, scattered trees and buildings. During the survey, swallow, wood pigeon and blackbird were identified within the site.

The site does not contain suitable habitat for ground nesting birds or wintering birds as it is predominately hardstanding and buildings and is also prone to constant human disturbance. It is considered that these species will not be adversely impacted by the proposals.

Bats

The buildings (B1-B4) on site offer **moderate** potential to support bat roosts as detailed above in section 4.3. Evidence of bats was not identified within the site during the survey. An offsite oak tree that partially hangs over the western site boundary was noted to be ivy-clad and was assessed to provide **low** bat roost potential. The remaining trees on site were assessed to provide **negligible** bat roost potential during the time of the survey.

The scrub, tall ruderal and scattered trees within the site provide some limited suitability for commuting and foraging bats, with good connectivity to the surrounding land use.

Badger and other small mammals

The scrub, tall ruderal and scattered trees habitats within the site provide limited foraging and shelter habitat for badger and other small mammal species such as hedgehog. The site is well connected to the surrounding land use including Brick Wall Covert LWS that lies adjacent to the western site boundary. No evidence of badger or hedgehog was identified within the site during the survey.

Amphibians

No ponds are present within the site. One pond (TN4) that lies 80m north-east of the site and a second pond that lies 250m north-west of the site within Brick Wall Covert Local Wildlife Site (LWS). A further nine ponds are present within 500m of the site as mapped on Magic Maps.

The habitats within the site (scrub, scattered trees and tall ruderal) provide terrestrial habitats for amphibians and the site contains no physical barriers that prevent amphibians moving across the site to access offsite ponds.

Reptiles

The habitats within the site do not offer suitability to support reptiles. Ecotones are not present within the site and the habitats are scattered across the site with no suitable connectivity. The habitats within the site are prone to high human disturbance. Additionally, no records of reptiles were returned within 2km of the site. Reptiles do not require further consideration within this planning application and will not be discussed further within this report.

Invasive species

No non-native invasive species were identified within the site during the walkover survey.

Red Squirrel

Records were returned for red squirrel and the site provides some limited habitat for red squirrel within the scattered trees along the site boundaries. The site is well connected to Brick Wall Covert LWS to the west and the surrounding land use.

Brown Hare

Records were returned for brown hare however, there is no suitable habitat onsite for these species as the site is predominately hardstanding and buildings. It is considered that brown hare will not be adversely impacted by the proposals and will not be discussed further within this report.

Otter

Records were returned for otter within 2km of the site however there is no suitable aquatic habitat for otter on or within the vicinity of the site. Additionally, the majority of records returned were from Hockenhull Plats and River Gowy, approximately 1.9km south-east of the site. It is considered that otter will not be adversely impacted by the proposals and will not be discussed further within this report.

Water vole

Records were returned for water vole within 2km of the site, however there is no suitable aquatic habitat for water vole onsite or within the vicinity of the site. The site provides very little terrestrial habitat for water vole as it is predominately hardstanding and buildings making it unsuitable burrowing or foraging habitat for water vole. It is considered that water vole will not be adversely impacted by the proposals and will not be discussed further within this report.

5.0 Evaluation and Recommendations

5.1 Designated Sites and Habitats

There are no statutory sites within 2km of the development site, however multiple statutory sites including Sefton Coast SAC, Ribble and Alt Estuaries SPA, Ribble and Alt Estuaries Ramsar site, Mersey Narrows and North Wirral Foreshore SPA; and Mersey Narrows and North Wirral Foreshore Ramsar site lie within 5km of the site. These sites are protected under the Conservation of Habitats & Species Regulations 2017 (as amended). The possibility significant effects on European national and international sites area minimal due to the separation distance of over 5km means visual and noise impacts during construction phase will not significantly impact qualifying species of the European sites. Additionally, the increase of residential dwellings proposed will not provide a significant increase in operational impacts in terms of recreational pressure alone due to the existing usage of the Sefton Coast.

Non-statutory site Brick Wall Convert Local Wildlife Site (LWS) lies adjacent to the western site boundary. The proposals may indirectly influence the LWS due to the increase in recreational use from the new dwellings. Brick Wall Convert LWS is of particular importance to wildlife and supporting the local biodiversity and provides connectivity to the surrounding area. The site is recorded to support at least three locally rare species of plant including black bent, red bartsia and erect hedge-parsley. A mitigation strategy is recommended during the works to protect the area. The mitigation strategy will include monitoring throughout and following the completion of the proposed works to ensure no negative impacts are caused to the LWS. It is recommended that the northern and western site boundaries should be retained and enhanced within the proposals to provide a buffer between the LWS and development site. It is further recommended that connectivity to the site and the LWS is provided throughout and after the completion of the works.

The remaining non-statutory protected sites within the vicinity of the proposals are unlikely to be directly impacted by the proposals as they all lie over 450m from the site however, it is possible that there will be a small increase in recreational pressure to the surrounding non-statutory sites due to proposals. It is considered that there will be no adverse impact on any statutory or non-statutory sites in the vicinity as a result of the proposals.

The site lies within a Natural England SSSI Impact Risk Zone; however, Natural England will not need to be consulted for this type of planning proposal within the residential area as the proposed development does not fall under the likely impacts for the SSSI as detailed on MAGIC Maps. It is considered that there will be no impact on any SSSIs in the vicinity as a result of the proposals.

It is further recommended that trees along the site boundaries are retained and enhanced where possible to maintain connectivity throughout the site and to Brick Wall Convert Local Wildlife Site (LWS) that lies adjacent to the western site boundary. However, if any trees are to be removed to accommodate proposals, replacement planting comprising two additional trees for every tree lost is advised (Policy CS21 Greenspaces and Trees within Local Plan).

The habitats on site comprise hardstanding, scrub, tall ruderal, scattered trees and buildings. These habitats are considered to have an ecological value of **within the zone of influence** of the site or lower. The site contains no designated or priority habitats. The site does lie within the Green Belt; however, the site is already currently developed for industrial use and trees along the site boundaries provide natural screening to the existing development. Overall, the proposals are unlikely to adversely affect the ecological value of the area.

The production of the Defra Metric Biodiversity Net Gain Calculations is recommended to minimise impacts of biodiversity and provide net gains in biodiversity and the production of a Management Plan to ensure the long-term commitments to manage the planting, protection and enhancement of biodiversity in and around the new development site.

5.2 Protected and Notable Species

Birds

The scattered trees, buildings, tall ruderal and scrub provide suitable habitat for nesting and foraging bird species. It is recommended that vegetation clearance, pruning and building works should be undertaken outside of the nesting bird season (1st March to 31st August Inclusive) to avoid any impact on breeding birds. If works cannot be undertaken outside of the breeding bird season, a nesting bird check undertaken by a suitably experienced ecologist should be undertaken immediately prior to works commencing. If an active birds' nest is identified a suitable buffer zone should be implemented where no works are to occur within until the young have fledged the nest.

Bats

Bat records were returned within 2km of the site. The closest record was recorded 240m south-west of the site.

The habitats on site provide **low** suitability for commuting and foraging bats. The buildings (B1-B4) on site were assessed to provide **moderate** potential for bats due to the multiple access points identified under the facias and between the brickwork walls. The buildings (B1-B4) will be demolished to accommodate the proposals within the site.

A dusk emergence survey was carried out at buildings B1, B2, B3 and B4 on 5th September 2022 by Lizzie Atkinson (Lead Surveyor), Evie Berry, Lauren Hadford, Amy Swindells, John Lindsay and Hannah Pimpen. During the survey four common pipistrelle bats were recorded to emerge from building B2. No bats were identified to emerge building B1, B3 and B4. A moderate level of activity was recorded with common pipistrelle, soprano pipistrelle and noctule foraging and commuting activity recorded within the site.

A dawn re-entry survey was carried out at buildings B1, B2, B3 and B4 on 22nd September 2022 by Liz Kenyon (Lead surveyor), Lauren Hadford, Niall Doherty, Hannah Pimpen, Darnell Shaw and John Lindsay. No bats were identified to re-enter buildings B1, B2, B3 and B4 and a low level of bat activity was recorded with common pipistrelle, soprano pipistrelle, brown long-eared bat and noctule foraging and commuting activity recorded throughout the survey.

An updated dusk emergence survey was carried out on buildings B1, B2, B3 and B4 on 3rd May 2023 by Lizzie Atkinson (Lead surveyor), Jack Kay, Amy Swindells, Evie Berry, Jordan Thomas and Dan Charters. During the survey, a single common pipistrelle bat was recorded to emerge from building B2. A moderate level of activity was recorded with common pipistrelle, soprano pipistrelle and noctule foraging and commuting activity recorded within the site. No bats were identified to emerge building B1, B3 and B4.

A dawn re-entry survey was carried out of buildings B1, B2, B3 and B4 on 9th June 2023 by Lizzie Atkinson (Lead surveyor), Amy Swindells, Shona Bancroft, Harriet Cox and Niall Doherty. During the survey, a very low level of activity was recorded with common pipistrelle and noctule foraging and commuting recorded within the site. No bats were identified re-entering buildings B1, B2, B3 and B4.

The nocturnal bat surveys carried out in 2022 and 2023 are detailed within the report *Ascerta P.1712.22A Bat Nocturnal Surveys, Netherley Road, Rev A* which should be read in conjunction with this report.

An application to Natural England will be required with regards to acquiring a European Protected Species licence in order that the bat roost identified in building B2 can be destroyed in the appropriate manner.

The nocturnal surveys carried out in 2022 and 2023 confirmed that buildings B1, B3 and B4 are not being used as a roost by bats at the time the surveys. It is recommended that a Bat Mitigation Methods Statement is produced and implemented prior to the start of works to ensure there is no loss of roosting provision, this will include the provision of bat boxes. It is further recommended that works occur during the winter months between October and March and a Tool Box Talk is given to all contractors prior to the start of works. Soft demolition only under ecological supervision may also be required for works within close proximity of B2 with the identified bat roost. As a bat roost has been identified within B2, which directly connects to buildings B1 and B3, a nocturnal survey immediately prior to the start of works may be required to ensure bats are not using the buildings as a roost.

An offsite oak tree that partially hangs over the western site boundary was noted to be ivy-clad and was assessed to provide **low** bat roost potential. It is currently unknown which trees are to be removed or pruned to accommodate proposals but if this oak tree is to be pruned at a later date to accommodate proposals, it may require further inspection of soft felling in the presence of a licensed ecologist.

The remaining trees on site were assessed to provide **negligible** bat roost potential during the time of the survey, however bat roost features can develop as trees age, therefore if works have not begun by June 2024, a preliminary roost assessment of all trees to be removed or pruned to accommodate proposals is recommended.

Badger and other small mammals

The site provides limited habitat for badger and hedgehog within the scrub and scattered trees and Brick Wall Covert LWS lies adjacent to the western site boundary. These onsite habitats are likely to be impacted by the proposals and therefore, it is recommended that a Badger and Hedgehog Reasonable Avoidance Measures (RAMS) Method Statement is implemented during the works to avoid harm to this species. The RAMS should include:

- Vegetation clearance applies to all habitats cleared in daytime air temperatures above 5°C. Works must be avoided in cold temperatures or if prior overnight temperatures have been less than 1°C;
- The cut material is to be chipped and placed in discrete piles outside the working areas or removed from the site;
- Existing tracks should be utilised for vehicle movements where possible;
- Throughout the works all trenches must be covered at night or ramps provided to prevent badger and hedgehog from getting stuck. Large pipes must also be covered to prevent badger access and risk of these species getting stuck; and
- Construction material will be stored on pallets to avoid creating habitat for hedgehog and badger.

To enable hedgehog continued use of the site it is advised that gaps of at least 13cm by 13cm are left under any new garden fences to enable hedgehog to roam freely within the area following development.

Amphibians

No ponds are present within the site. One pond (TN4) that lies 80m north-east of the site and a second pond that lies 250m north-west of the site within Brick Wall Covert Local Wildlife Site (LWS). A further nine ponds are present within 500m of the site as mapped on Magic Maps. The two offsite ponds within 250m of the site were assessed for GCN suitability on 3rd May 2023 by Lizzie Atkinson and Liz Kenyon. The two ponds both returned a poor GCN HSI score and were ephemeral within limited aquatic vegetation present, making for unfavourable breeding habitat for GCN. It is considered that GCN are unlikely to present within the site and will not be impacted by the proposals.

The terrestrial habitats do provide refuge areas and connectivity corridors for amphibians and there are no physical barriers from preventing amphibians access to the site. These habitats are likely to be impacted by the proposals and therefore, it is recommended as the areas to be lost and small in size that an Amphibian Reasonable Avoidance Measures (RAMS) Method Statement is produced and implemented during the works to avoid harm to this species.

Red Squirrel

Red squirrel records were returned within 2km of the site and the onsite habitats provides some limited habitat for red squirrel within the scattered trees and the site is well connected to the surrounding land use including Brick Wall Covert LWS that lies adjacent to the western site boundary. It is recommended that the trees to the site boundaries are retained to allow red squirrel to move through the site. To enhance the site further for red squirrel it is recommended that any future landscaping uses small seed-bearing species that encourage red squirrel. Favourable tree species include Scots pine, willow, rowan and hawthorn (full red squirrel recommended planting is listed in section 5.3).

5.3 Enhancements

In order to meet requirements for biodiversity protection and enhancement outlined within the NPPF, it is recommended that ecological enhancements are included. These could include:

1. Provision of 4 bird boxes (28mm and 32mm entrance hole box, house sparrow terrace, swift box), attached to or integrated within new buildings or retained tree on site;
2. Provision of 4 bat features (e.g. Vivara Pro WoodStone Bat box or similar) attached to a retained tree on site or provision of a bat box (e.g. Vivara bat bricks or '*bird brick houses*' bat boxes) integrated within new buildings;
3. Planting that is favourable for red squirrel to provide areas of refuge and to improve connectivity to surrounding landscape. Suitable tree species to include in landscaping include Scots pine, willow, rowan, birch, hawthorn, blackthorn, alder and holly;
4. Replacement tree planting for any trees due to be removed to accommodate proposals comprising two additional trees for every tree lost; and
5. Retain and enhance site boundaries to enhance connectivity to the surrounding land use with suitable landscaping incorporating species that provide a food or shelter resource to wildlife to include hawthorn, hazel, holly, blackthorn, field maple, dog rose and honeysuckle as hedgerow species and oak, alder, field maple, silver birch, crab apple, rowan and bird cherry as tree species together with implementing a relaxed mowing regime and establishing wildflowers in these areas.

6.0 Conclusions

The site was subject to an extended phase one habitat survey and a preliminary bat roost assessment of all buildings. During the survey and following review of historical species records, it is considered that an impact on birds, bats, badger, amphibians and hedgehog are likely to occur in relation to the proposals for the site. The following recommendations have been made to avoid an impact on these species:

- An application to Natural England will need to be made with regards to acquiring a European Protected Species licence in order that the bat roost can be destroyed in the appropriate manner at building B2;
- If works are not begun by June 2024, a preliminary bat roost assessment of all trees to be removed or pruned to accommodate proposals will be required to inform further recommendations if required;
- Production of a Bat Mitigation Measures report to be produced and implemented to ensure there is no loss of roosting provision or harm to bats during the works;
- Soft demolition of buildings B1 and B3 under ecological supervision and a Tool Box Talk to be given to all contractors;
- Production and implementation of a Construction Environmental Management Plan (CEMP) to protect Brick Wall Covert Local Wildlife Site (LWS) that lies adjacent to the western site boundary during works;
- Sensitive lighting to be used to meet the Bat Conservation Trust lighting guidance so not to cause a detrimental effect to light sensitive species;
- Production and implementation of an amphibian RAMS to avoid any harm to this species during the proposed works;
- Implementation of a badger and hedgehog RAMS (section 5.2) to avoid any harm to this species during the proposed works;
- Vegetation clearance, pruning and building works should be undertaken outside of the nesting bird season (1st March to 31st August Inclusive) to avoid any impact on breeding birds. Or a nesting bird check undertaken by a suitably experienced ecologist should be undertaken immediately prior to works commencing;
- Provision of planting that is favourable for red squirrel to provide areas of refuge and to enhance connectivity to the surrounding landscape (section 5.3);
- Retain and enhance site boundaries through appropriate landscape planting that includes native, species rich hedgerows, trees and areas of wildflowers plus provision of integrated bat and bird features within newly constructed buildings;
- Production of the Defra Metric Biodiversity Net Gain Calculations to minimise impacts on biodiversity and provide net gains in biodiversity; and
- Production of a Management Plan to ensure the long-term commitments to manage the planting, protection and enhancement of biodiversity in and around a new development site.

It is considered that there would be very limited impacts on the local ecology as a result of the proposals, provided the recommendations detailed within section 5.0 above are followed.

Appendix 4

Relevant Legislation

European Legislation

The following Directives have been adopted by the European Union and provide protection for fauna and flora species of European importance and the habitats which support them:

- Directive 2009/147/EC on the Conservation of Wild Birds (Birds Directive);
- Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild fauna and flora (Habitats Directive).

UK Legislation

The Habitats Directive has been transposed into national legislation through the Conservation of Habitats and Species (Amendment) (EU Exit) Regulations 2019 (The Habitats Regulations). This provides for the designation and protection of 'European Sites' (SPAs, SACs and Ramsar Sites, including proposed or potential European Sites) and the protection of 'European Protected Species'.

The key UK legislation relating to nature conservation is the Wildlife and Countryside Act 1981 (as amended) (W&C Act). This Act is supplemented, *inter alia*, by provision in the Countryside and Rights of Way (CROW) Act 2000, and the Natural Environment and Rural Communities Act 2006 (NERC Act). Additional species and habitat specific UK legislation includes the Protection of Badgers Act 1992 and the Hedgerow Regulations 1997.

The Environment Act sets out how the UK will maintain environmental standards following leaving of the EU. The Bill builds on the vision of the 25 Year Environment Plan, with the ambition from the government to leave the environment in a better state than it was when inherited.

The Defra Biodiversity Metric is being implemented to work alongside the Environment Act. This tool calculates potential biodiversity impacts as a result of development and identifies mitigation and compensation requirements to ensure no net loss of biodiversity. In addition, it identifies measures that can be implemented in order to meet Biodiversity gain as a result of development. Defra released a beta version of the biodiversity metric in July 2019, with the most recent revision in March 2023. This metric is likely to be the default metric used by councils, with the most recent version to be submitted to support a planning application.

The National Planning Policy Framework (NPPF) 2021 has been published to provide further planning guidance. Wildlife, biodiversity and ecological networks are referred to in Section 15 '*Conserving and enhancing the natural environment*'. The NPPF states that the planning system should contribute to and enhance the natural and local environment by: recognising the wider benefits of ecosystem services, minimising impacts on biodiversity and providing net gains for biodiversity, including by establishing coherent ecological networks that are more resilient to current and future pressures. Further guidance is provided within Government Circular 06/05: *Biodiversity and Geological Conservation - Statutory Obligations and Their Impact Within the Planning System*.

Species and Habitats of Principal Importance

Species and Habitats of Principal Importance are listed under section 41 of the NERC Act and are a material consideration in planning decisions. Planners require relevant, up to date information from ecological surveys in order to assess the effects of a proposed development on biodiversity as Councils have a statutory obligation under section 40 of the NERC Act to consider biodiversity conservation in the determination of planning applications.

Background information about the lists of priority habitats and species (Species and Habitats of Principal Importance) can be found within the UK Biodiversity Action Plan (UK BAP). Although this has been succeeded by the '*UK Post-2010 Biodiversity Framework*', many of UK BAP tools are still relevant. BAPs identify habitats and species of nature conservation priority on a UK (UK BAP) and Local (LBAP) scale. Most BAP priority habitats and species have Habitat Action Plans (HAP) and Species Action Plans (SAP) and there are also "grouped action plans" for groups of related species with similar conservation requirements. The LBAP relating to this Site is the North Merseyside Biodiversity Action Plan.

Badgers

The legislation protecting badgers in England and Wales is the Protection of Badgers Act 1992.

Under the Protection of Badgers Act 1992 it is an offence *inter alia* to:

- Wilfully kill, injure or take a badger, or to attempt to do so;
- Cruelly ill-treat a badger; or
- Intentionally or recklessly interfere with a badger sett by (a) damaging a sett or any part of one; (b) destroying a sett; (c) obstructing access to or any entrance of a sett; (d) causing a dog to enter a sett; or (e) disturbing a badger when it is occupying a sett.

The Badger Act 1992 defines a badger's sett as "*any structure or place which displays signs indicating current use by a badger*"

Natural England can issue licences to enable works to continue that may affect a protected species. In relation to disturbance of badgers, Natural England (2009) gives guidelines on disturbance which will require a licence. These includes: "*using very heavy machinery (generally tracked vehicles) within 30 metres of any entrance to an active sett; using lighter machinery (generally wheeled vehicles), particularly for any digging operation, within 20 metres; light work such as hand digging or scrub clearance within 10 metres. There are some activities which may cause disturbance at greater distances (such as using explosives or pile driving) and these should be given individual consideration.*"

Bats

In England, all bats and their roosts are protected under the Conservation of Habitats and Species Regulations 2017 and the Wildlife & Countryside Act 1981 (as amended). Several species of bat are also highlighted as Priority Species under the UK Biodiversity Action Plan and within the Local BAP.

Under the current legislation as summarised on pages 8 and 9 of the Bat Surveys for Professional Ecologists Good Practice Guidelines – 3rd Edition (2016) it is a criminal offence to:

“To kill, capture, injure or take a wild bat;

- To damage or destroy a place used by a bat for breeding or resting. All offences of this nature are identified within the Habitats Regulations. This offence is unique in that it can be committed accidentally. No element of intentional, reckless or deliberate action needs to be evidenced;*
- To disturb bats anywhere (roosts, flight lines or foraging areas) if levels of disturbance can be shown to impair their ability to survive, to breed or reproduce, to rear or nurture their young, to hibernate or migrate or to affect significantly local distribution or abundance;*
- To intentionally or recklessly disturb a bat, whilst it is occupying a place of shelter or protection;*
- To intentionally or recklessly obstruct access to any place used by a bat for shelter or protection; and*
- To be in possession or control of a bat alive or dead (or any part of a bat or anything derived from a bat, although bat droppings are generally considered to be acceptable), or to transport a bat, to sell or exchange a bat or to offer to sell or exchange a bat taken from the wild.”*

Breeding Birds

Breeding Birds are protected under the Wildlife and Countryside Act which make it an offence to:

- intentionally kill, injure or take any wild bird or take, damage or destroy the nest of any wild bird whilst it is in use or being built;*
- intentionally take or destroy the egg of any wild bird;*
- have in one's possession or control any wild bird, dead or alive, or any part of a wild bird (including eggs), which has been taken in contravention of the Act or the Protection of Birds Act 1954;*
- intentionally or recklessly disturb any wild bird listed on Schedule 1 while it is nest building, or at a nest containing eggs or young, or disturb the dependent young of such a bird.*

Great Crested Newt

The great crested newt (*Triturus cristatus*) is fully protected under the Wildlife and Countryside Act, 1981 (as amended) and the Habitats Regulations, 2017. It is also a Species of Principal Importance. The legislation makes it an offence to:

- Deliberately (or intentionally) kill, injure or capture (or take) a great crested newt, or great crested newt egg or eft;*

- *Deliberately (intentionally) damage or destroy any breeding site or resting place (i.e. pond, refuge, hibernaculum);*
- *Deliberately or recklessly obstruct access to any breeding site or resting place;*
- *Deliberately, intentionally or recklessly disturb a great crested newt, in particular disturbance which is likely to:*
 - *impair the ability of the great crested newt to survive, breed, reproduce, or to rear or nurture young;*
 - *impair the ability of the great crested newt to hibernate or migrate; or significantly affect the local distribution or abundance of great crested newts*

Invasive Species

It is an offence under Section 14(2) of the Wildlife and Countryside Act 1981 to '*plant or otherwise cause to grow*' in the wild any plant in Schedule 9 Part II.

Other Aquatic Species

Water vole (*Arvicola amphibious*) are a Species of Principal Importance and also fully protected under Schedule 5 of the Wildlife and Countryside Act 1981 (as amended) which makes it an offence to:

- *intentionally or recklessly damage, destroy or obstruct access to any structure or place used for shelter or protection;*
- *intentionally or recklessly disturb water voles whilst occupying a structure or place used for that purpose;*
- *intentionally kill, injure or take water voles;*
- *possess or control live or dead water voles or derivatives;*
- *sell water voles or offer or expose for sale or transport for sale; and*
- *publish or cause to be published any advertisement which conveys the buying or selling of water voles.*

Invertebrates

The site's suitability for supporting invertebrates was assessed during the site visit. This included making note of key plant species that could be used by notable invertebrates, together with incidental invertebrates recorded on the day.

It is a criminal offence to intentionally, wilfully kill, injure or take any of the aforementioned protected species or to destroy or disturb its habitat.

Local Policy

The site lies within Knowsley and is covered by The Knowsley Local Plan Core Strategy (adopted 6th January 2016). Policies CS2 (Principal 4) and CS8 aim to ensure biodiversity is retained and enhanced during development and biodiversity protection is referenced in other policies including CS19, CS21, CS23 and CS24. These policies have been taken into account when preparing this report.

Merseyside BioBank biodiversity information report

These are the results of your data request relating to **an area at Netherley Road, Tarbock Green defined by a buffer of 2000 metres around the centre of grid reference SJ46208762.**

You have been supplied with the following:

- records of **protected** taxa that intersect the search area
- records of **BAP** taxa that intersect the search area
- records of **Red Listed** taxa that intersect the search area
- records of other '**notable**' taxa that intersect the search area
- records of WCA schedule 9 taxa (including '**invasive plants**') that intersect the search area
- a map showing the location of monad and tetrad references that overlap the search area
- a list of all **designated sites** that intersect your search area
- citations, where available, for intersecting Local Wildlife Sites
- a list of **other sites of interest** (e.g. Ancient Woodlands) that intersect your search area
- a map showing such sites
- a list of all **BAP habitats** which intersect the search area
- a map showing BAP habitats
- a summary of the area for all available mapped **Phase 1 and/or NVC habitats** found within 500m of your site
- a map showing such habitats

Merseyside BioBank (MBB) is the Local Environmental Records Centre (LERC) for North Merseyside. We collect and collate biological and environmental information and make it available to people and organisations that have need to access such information in North Merseyside. We promote the North Merseyside Biodiversity Action Plan and wider participation in biological recording and conservation through education, community involvement and by supporting the biological recording community of North Merseyside.

Merseyside BioBank is an information node of the National Biodiversity Network (NBN) and integrate records from our own databases with those of the NBN Atlas.

The product charge for this data request is not a charge for the data themselves, but rather a fixed rate that enables us to cover a portion of our running costs. Our annual income from data requests is something less than 20% of our total running costs.

Species records

The biological records held by Merseyside BioBank come from a variety of sources; from large organisations to individual amateur naturalists. Merseyside BioBank operates as managers or custodians of these records but the individuals and groups, who provide their records free of charge, retain copyright on their data. Without their contribution, we would not be able to provide the records included in this report. Their efforts, expertise and goodwill make a substantial contribution to the protection of North Merseyside's biodiversity.

You may only use the records in this document subject to our access terms and conditions which can be found in Appendix 1. Non-adherence to these terms and conditions will be viewed as a breach of contract, which may result in legal redress being sought.

This report also integrates records from the NBN Atlas. Some NBN data providers give us permission to download and integrate their records at a higher resolution than available through public access in order to contribute to the protection of North Merseyside's biodiversity.

Details of the biological records summarised in the following tables, and the sources from which they are derived, are included in appendix 2 of this report. Note that the date ranges in the summary tables (headed 'Dates') show the earliest and latest years for which records have been summarised for each taxon.

UK Protected Species

'UK Protected species' are those taxa specifically identified by UK legislation including: Wildlife & Countryside Act 1981 (as amended); Protection of Badgers Act 1992; Conservation of Habitats and Species Regulations 2017. The latter regulations enact the European Union's (EU) Habitats Directive (92/43/EEC) in the UK and supercede The Conservation Regulations 1994 and 2010. In our list of protected species, you may see designations that refer to schedules in the 1994 and 2010 regulations, but these remain unchanged under the 2017 regulations.

Some protected species may not be legally disturbed unless you are in possession of an appropriate license. If you are in any doubt as to whether or not a license is required, you should contact Natural England.

The following tables detail the protected species that were recorded in the search area.

Group	Common Name	Scientific Name	Records	Dates	Designations
amphibian	Common Frog	<i>Rana temporaria</i>	94	1981-2021	WCA5/9.5a
	Common Toad	<i>Bufo bufo</i>	35	1971-2021	WCA5/9.5a

North Merseyside BAP Species

The North Merseyside Biodiversity Action Plan (NM BAP) was published in September 2001 and last reviewed in 2008. Like other Local Biodiversity Action Plans (LBAPs) its purpose is to focus local conservation on national priority species and habitats. However, LBAPs also embrace the idea of 'local distinctiveness' and species which are not considered UK conservation priorities can be catered for by LBAPs if they are of particular local significance. Such is the case with the NM BAP which currently names 74 species of which 57 are not conservation priority species but are included because their conservation is considered to be a priority in North Merseyside.

The following tables detail the North Merseyside BAP species that were recorded in the search area.

Group	Common Name	Scientific Name	Records	Dates	Designations
amphibian	Great Crested Newt	<i>Triturus cristatus</i>	17	2004-2021	LBAP
bird	Corn Bunting	<i>Emberiza calandra</i>	12	1994-2005	LBAP

	Whiskered/Brandt's Bat	<i>Myotis mystacinus/brandtii</i>	1	2003	LBAP

Desig. Code	Desig. Name	Designation Description
LBAP	North Merseyside BAP	Species that are incorporated within the North Merseyside Biodiversity Action Plan. These species may or may not also be UK BAP species. Some species have their own action plans within the NM BAP, others are members of group species action plans.

NM BAP species: Great Crested Newt (*Triturus cristatus*)

Great Crested Newt is thought to have been in decline since the 1940s. Over a period of five years in the 1980s 2% of all UK colonies were lost, and although Britain remains a stronghold for this species, it is now considered to be dependant on conservation and is afforded international protection.

There is no current North Merseyside population estimate, though recent surveys suggest that in the general North West area around 25% of ponds have Great Crested Newts. A study of the parts of the Sefton Coast showed that a number of populations were present.

This species is highly dependant on the quality of ponds and also the habitat in the surrounding area (where they forage and hibernate away from the water). Habitat loss is the greatest cause of decline with many ponds being drained or drying up as a result of natural succession. Removal of scrub and woodland in addition to over-grazing and intensive management of surrounding grassland is also detrimental. Other factors which may affect population levels include predation by fish and waterfowl, habitat fragmentation and pollution.

NM BAP species: Corn Bunting (*Emberiza calandra*)

Nationally this species has significantly declined with a loss of 90% of the UK population between 1970 and 2005 and large contractions in the species range.

Locally Corn Bunting is thought to have undergone severe declines with only an estimated 200 pairs remaining in 1997-99. Corn Buntings are sparsely distributed across much of North Merseyside's arable farmland.

Declines are thought to be caused by changes in agricultural practices. Sowing cereals later in the year, increasing use of herbicide and the removal of fallow fields have all greatly reduced winter seed sources. Increasing use of pesticides has reduced the availability of invertebrate food sources. Earlier crop harvesting may also result in the destruction of some nests, especially where there are limited uncropped areas.

NM BAP species: Grey Partridge (*Perdix perdix*)

The UK population of Grey Partridge declined by 88% between 1970 and 2005 and though still widespread shows distinct variation according to agricultural practices. In North Merseyside there were an estimated 300 pairs in 1997-99 and they are present in all suitable habitat.

Loss of suitable habitat is the main cause of decline in this species, with changes in agricultural practices being particularly detrimental. The amalgamation of small fields into a larger ones and the removal of hedgerows, ditches and other field margins have destroyed potential nesting sites. Changes in sowing, harvesting and crop type have removed essential winter food sources.

NM BAP species: Urban Birds (*Delichon urbicum*; *Passer domesticus*; *Sturnus vulgaris*; *Apus apus*)

The four species covered by the NM BAP Urban Birds Species Action Plan (House Martin, Swift, House Sparrow and Starling) are considered to be in significant decline across the UK. In North Merseyside House Sparrows and Starlings currently breed in all urban areas, while House Martins are restricted to areas nearer sources of mud for nest-building. Swifts occurred in only 55 tetrads during 1997-2000.

Urban bird numbers are thought to relate strongly to the availability of prey species, and nesting opportunities.

Declines are most likely caused by the reduction in the diversity and abundance of invertebrate prey species resulting from increased 'tidiness' in our parks and gardens, the use of pesticides and other changes in farm practices. The exclusion of urban birds from breeding in or around modern buildings reduces nesting opportunities for urban birds.

NM BAP species: Lapwing (*Vanellus vanellus*)

Between 1987 and 1998 Lapwing declined by 48% in England and Wales with Wales and the SW of England showing greatest loss. Two thirds of the population is now resident in the N and NW of England.

Locally this species continues to breed in all suitable habitats and the 2002-03 surveys indicated a population of around 1,500 pairs with arable farmland and pockets of grassland being particularly favoured.

Local threats are thought to include development in nesting areas, increasing recreation and disturbance, scrub encroachments on coastal grassland and changes in farm practice towards silage production, livestock and agricultural intensification.

NM BAP species: Skylark (*Alauda arvensis*)

Although Skylark is widespread throughout Europe and large numbers are thought to breed in the UK, it is in significant decline with a fall in the population of 75% between 1972 and 1996 on lowland farms and an overall fall in the UK population of 53% between 1970 and 2005.

Locally Skylark breeds in all remaining suitable habitat and in 1997-2000 there were 750 breeding pairs but declines are thought to reflect the national trend.

This species relies heavily on traditional arable farming and so declines have largely been due to changes in farming practices in recent decades. Conversion to silage production, changes in sowing times and general agricultural intensification have all been particularly detrimental by reducing nesting habitat and sources of food.

Other causes of decline include overgrazing, disturbance during the breeding season and loss of grassland to development and tree planting.

NM BAP species: Song Thrush (*Turdus philomelos*)

Although still widespread, Song Thrush declined sharply by around 73% in farmland (mid 1970s) and 49% in woodland (1968-1993), while overall UK numbers fell by 50% between 1970 and 2005. The North of the UK is thought to have been hit hardest.

In North Merseyside, though thinly distributed, Song Thrush still breed in most areas with an estimated 500 pairs during 1997-2000. Highest breeding concentrations were found to occur in suburban areas where abundant garden and parkland habitats were present.

Song Thrush are reliant on a variety of habitats to meet their needs at different times of the year and loss of these habitats causes a reduction in numbers.

Local factors in the decline of the species include changes in farm practices that remove nesting habitat (hedgerows and dense scrub), limit the abundance of winter food (changes in sowing, cropping and use of herbicides/molluscicides) or cause the loss of feeding habitat (use of pesticides/herbicides and monocropping).

NM BAP species: Bluebell (*Hyacinthoides non-scripta*)

British Bluebells make up about 20% of the global population of *Hyacinthoides non-scripta* and are often found in humid woodland habitat, along hedgerows and on occasion along the coast. Locally there are a number of good colonies.

Local threats to the species include possible over-shading in un-managed woodlands, localised trampling by the public in popular areas and hybridisation with the Spanish Bluebell. On a national scale declines are caused by the loss of woodland habitat, grazing by introduced Muntjac, collection of plants and hybridisation with Spanish Bluebell.

NM BAP species: Dragonflies (*Coenagrion puella*; *Calopteryx splendens*; *Orthetrum cancellatum*; *Ischnura elegans*; *Libellula depressa*; *Aeshna grandis*; *Enallagma cyathigerum*; *Sympetrum striolatum*; *Aeshna juncea*; *Anax imperator*; *Libellula quadrimaculata*; *Aeshna mixta*; *Sympetrum sanguineum*; *Aeshna cyanea*)

Twentyone species of dragonfly and damselfly are included in the NM BAP Dragonflies Species Action Plan. These include vagrant species and some which are thought to be undergoing range expansions in the UK. Eighteen of these species are known to breed in our local area, with significant breeding sites in St Helens and Sefton.

Local causes of decline in this include the destruction or damage of essential wetland habitat through development, waste-tipping and agricultural run-off. Removal of nearby feeding habitats such as woodlands, hedgerows and tall vegetation is also detrimental.

NM BAP species: Brown Hare (*Lepus europaeus*)

Whilst still well distributed in North Merseyside it is thought that the local population of Brown Hare declined in-line with National trends which have shown severe declines in the western pastoral parts of the country to around 20% of the numbers present in Victorian times.

Reasons for local declines are thought to include loss and fragmentation of suitable habitat to development, illegal hunting and changes in farming practices and land use that cause increased disturbance (changes in cropping/sowing times, livestock trampling and recreation).

NM BAP species: Bats (*Plecotus auritus*; *Pipistrellus pipistrellus*; *Myotis daubentonii*; *Nyctalus noctula*; *Pipistrellus pygmaeus*)

The NM BAP Bats Species Action Plan covers all species found in North Merseyside since all are considered to be locally threatened.

Bat Species are found throughout North Merseyside, with Pipistrelles (Common/Soprano) most often encountered and Brown Long-eared and Noctules less common. Daubenton's are also frequently encountered in suitable wetland habitat. Whiskered, Brandt's and Natterers are considered rare locally.

Bat species will roost in many locations that are warm, dark, sheltered and little undisturbed. Such places can include derelict buildings, barns, roof spaces and tree hollows.

Factors causing declines in these species include the loss of prey insects due to the increased use of pesticides and general park/garden 'tidiness', loss and fragmentation of habitat mosaics, loss of winter roosts in old trees and buildings and intentional exclusion from buildings by people.

NM BAP species: Red Squirrel (*Sciurus vulgaris*)

Over the last 100 years the UK range Red Squirrel has contracted massively. In most areas the species of Britain it has vanished and most populations are now restricted to areas of Scotland and North England. North Merseyside has a relatively stable population on the Sefton Coast with small numbers across Knowsley and St Helens.

Threats include the Grey Squirrel which carries the squirrel pox virus that appears to have been the main cause of the red squirrel decline in Britain. In addition the fragmentation of woodland has reduced suitable habitat and increased road mortality as individuals try to move between pockets of habitats. Locally, over-maturation of trees will soon greatly reduce the Red Squirrels food source.

NM BAP species: Water Vole (*Arvicola amphibius*)

This species is found throughout Britain but localised to areas of suitable habitat near water. Previously common this species has undergone severe range and population reductions, with a national survey showing a decline of around 89% since 1939, estimated to increased to a loss of 94% by 2000. Merseyside appears to be a stronghold for the species with 75% of sites surveyed having Water Voles present in 1989-90. Though they may still be in decline locally, it is thought to be at a lower level than nationally.

Local declines in the species are caused by inappropriate management of bank-side habitats and waterside developments as well as predation by invasive species such as mink. The use of rodenticides and loss of habitat connectivity may also be factors in population declines.

NERC Act Section 41 Species

Known also as 'Species of Principle Importance in England' and the 'England Biodiversity List' this list was developed to meet the requirements of Section 40 of the Natural Environment and Rural Communities Act (2006). The list is derived, almost wholly, from the 2012 revised list of 'UK Post-2010 Biodiversity Framework' priority species. (So called 'research only' moth species have been excluded from the report.). The section 41 list is used to guide decision-makers such as public bodies, including local and regional authorities, in implementing their duty under section 40 of the Natural Environment and Rural Communities Act 2006 'to have regard' to the conservation of biodiversity in England, when carrying out their normal functions. In particular:

- Regional Planning Bodies and Local Planning Authorities must use it to identify the species that should be afforded priority when applying the requirements of National Planning Policy Framework (NPPF) to maintain, restore and enhance species and habitats.
- Local Planning Authorities must use it to identify the species that require specific consideration in dealing with planning and development control, recognising that under NPPF the aim of planning decisions should be to minimise impacts on biodiversity and geodiversity.
- All Public Bodies must use it to identify species that should be given priority when implementing the NERC Section 40 duty.

The following tables detail the NERC Section 41 species that were recorded in the search area.

Group	Common Name	Scientific Name	Records	Dates	Designations
amphibian	Common Toad	<i>Bufo bufo</i>	35	1971-2021	Sect.41

Desig. Code	Desig. Name	Designation Description
Sect.41	Natural Env. and Rural Communities Act 2006. Species of Principal Importance in England (section 41)	Species "of principal importance for the purpose of conserving biodiversity" covered under section 41 (England) of the NERC Act (2006) and therefore need to be taken into consideration by a public body when performing any of its functions with a view to conserving biodiversity.
Sect.41.suppl	Supplementary list to deal with S41 bird sub-sp problems	Bird species corresponding to British sub-species listed in section 41 (England) of the NERC Act (2006).

IUCN Red-listed Species

The IUCN Red List of Threatened Species (sometimes called 'Red Data Book' species) indicates the conservation status of plants and animals that have been globally evaluated using the IUCN Red List Categories and Criteria. The system is designed to determine the relative risk of extinction, and the main purpose of the IUCN Red List is to catalogue and highlight those plants and animals that are facing a higher risk of global extinction (i.e. those listed as Critically Endangered, Endangered and Vulnerable). The IUCN Red List also includes information on plants and animals that are categorized as 'Extinct' or 'Extinct in the Wild'; on taxa that cannot be evaluated because of insufficient information ('Data Deficient'); and on plants and animals that are either close to meeting the threatened thresholds or that would be threatened were it not for an ongoing taxon-specific conservation programme ('Near Threatened').

The following tables detail the IUCN Red-listed species that were recorded in the search area.

Group	Common Name	Scientific Name	Records	Dates	Designations
flowering plant	Box	<i>Buxus sempervirens</i>	3	2020	RLGB.DD
	Common Cudweed	<i>Filago vulgaris</i>	1	2008	RLGB.Lr(NT)
	Corn Chamomile	<i>Anthemis arvensis</i>	3	1989	RLGB.EN
	Corn Marigold	<i>Glebionis segetum</i>	2	2020-2021	RLGB.VU
	Creeping Spearwort	<i>Ranunculus reptans</i>	2	1987	RLGB.VU
	Field Woundwort	<i>Stachys arvensis</i>	1	2021	RLGB.Lr(NT)
	Heracleum sphondylium subsp. flavescens	<i>Heracleum sphondylium subsp. flavescens</i>	1	1986	RLGB.DD
	Large-flowered Hemp-nettle	<i>Galeopsis speciosa</i>	1	1987	RLGB.VU
	Marsh Stitchwort	<i>Stellaria palustris</i>	2	1987	RLGB.VU
	Stinking Chamomile	<i>Anthemis cotula</i>	1	1987	RLGB.VU
	Wood Bitter-vetch	<i>Vicia orobus</i>	1	1987	RLGB.Lr(NT)
fungus	Brown Birch Bolete	<i>Leccinum scabrum</i>	8	2010-2017	RLGB.DD
	Slate Bolete	<i>Leccinum duriusculum</i>	8	2010-2019	RLGB.Lr(NT)
insect - beetle (Coleoptera)	Alder Leaf Beetle	<i>Agelastica alni</i>	29	2013-2021	RLGB.DD
insect - butterfly	Wall	<i>Lasiommata megera</i>	3	1994	RLGB.Lr(NT)
	White-letter Hairstreak	<i>Satyrion w-album</i>	2	2010-2012	RLGB.EN
insect - dragonfly (Odonata)	Common Darter	<i>Sympetrum striolatum</i>	27	1990-2019	RLGB.DD
mollusc	Large Black Slug	<i>Arion (Arion) ater</i>	1	2011	RLGB.DD
	Marsh Pond Snail	<i>Stagnicola palustris/fuscus/corvus</i>	13	1991-2016	RLGB.DD
terrestrial mammal	Bat	<i>Chiroptera</i>	20	1987-2019	RLGB.CR,RLGB.DD,RLGB.EN,RLGB.Lr(NT),RLGB.VU
	Bats	<i>Vespertilionidae</i>	1	1989	RLGB.CR,RLGB.DD,RLGB.EN,RLGB.Lr(NT),RLGB.VU
	Eurasian Red Squirrel	<i>Sciurus vulgaris</i>	2	2008	RLGB.EN

European Water Vole	<i>Arvicola amphibius</i>	102	1989-2021	RLGB.EN
Myotis Bat species	<i>Myotis</i>	1	2007	RLGB.CR,RLGB.DD
Pipistrelle Bat species	<i>Pipistrellus</i>	13	1999-2015	RLGB.Lr(NT)
West European Hedgehog	<i>Erinaceus europaeus</i>	47	2003-2021	RLGB.VU

Desig. Code	Desig. Name	Designation Description
RLGB.DD	IUCN (2001) - Data Deficient	A taxon is Data Deficient when there is inadequate information to make a direct, or indirect, assessment of its risk of extinction based on its distribution and/or population status. A taxon in this category may be well studied, and its biology well known, but appropriate data on abundance and/or distribution are lacking. Data Deficient is therefore not a category of threat or Lower Risk. Listing of taxa in this category indicates that more information is required and acknowledges the possibility that future research will show that a threatened category is appropriate.
RLGB.Lr(NT)	IUCN (2001) - Lower risk - near threatened	Taxa which do not qualify for Lower Risk (conservation dependent), but which are close to qualifying for Vulnerable. In Britain, this category includes species which occur in 15 or fewer hectads but do not qualify as Critically Endangered, Endangered or Vulnerable.
RLGB.EN	IUCN (2001) - Endangered	A taxon is Endangered when it is not Critically endangered but is facing a very high risk of extinction in the wild in the near future.
RLGB.VU	IUCN (2001) - Vulnerable	A taxon is Vulnerable when it is not Critically Endangered or Endangered but is facing a high risk of extinction in the wild in the medium term future.
RLGB.CR	IUCN (2001) - Critically endangered	A taxon is Critically Endangered when it is facing an extremely high risk of extinction in the wild in the immediate future, as defined by any of the criteria A to E.

Nationally Notable Species

These are plants and animals which do not fall within red-list categories but which are none-the-less uncommon in Great Britain.

The following tables detail the Nationally Notable species that were recorded in the search area.

Group	Common Name	Scientific Name	Records	Dates	Designations
flowering plant	Aggregate-headed Hawkweed	<i>Hieracium aggregatum</i>	3	1981-1989	NR-excludes
	Box	<i>Buxus sempervirens</i>	3	2020	NR-excludes
	Creeping Spearwort	<i>Ranunculus reptans</i>	2	1987	NR-excludes
	Dittander	<i>Lepidium latifolium</i>	2	2020-2021	NS-excludes
	Fringed Water-lily	<i>Nymphaeodes peltata</i>	3	2005-2020	NS-excludes
	Grape-hyacinth	<i>Muscari neglectum</i>	2	2017	NR-excludes
	Jacob's-ladder	<i>Polemonium caeruleum</i>	1	2011	NR-excludes
	Water-soldier	<i>Stratiotes aloides</i>	3	1989-1998	NR-excludes
	Welsh Poppy	<i>Meconopsis cambrica</i>	1	2002	NS-excludes
	Wood Bitter-vetch	<i>Vicia orobus</i>	1	1987	NS-excludes
insect - beetle (Coleoptera)	Anitys rubens	<i>Anitys rubens</i>	1	1989	Nb
	Phloiodytra vaudoueri	<i>Phloiodytra vaudoueri</i>	1	1989	Nb
insect - true fly (Diptera)	Pocota personata	<i>Pocota personata</i>	1	1987	NS-excludes

Desig. Code	Desig. Name	Designation Description
NS-excludes	Nationally Scarce. Excludes Red Listed taxa	Nationally Scarce - Occurring in 16-100 hectads in Great Britain. Excludes rare species qualifying under the main IUCN criteria
NR-excludes	Nationally Rare. Excludes Red Listed taxa	Nationally Rare - Occurring in 15 or fewer hectads in Great Britain. Excludes rare species qualifying under the main IUCN criteria.
Nb	Nationally Notable B	Taxa which do not fall within RDB categories but which are none-the-less uncommon in Great Britain and thought to occur in between 31 and 100 10km squares of the National Grid or, for less-well recorded groups between eight and twenty vice-counties. Superseded by Nationally Scarce, and therefore no longer in use.

WCA schedule 9 species (including non-native invasive plants)

Schedule 9 of the Wildlife & Countryside Act (amended 2010) lists species of plants and animals for which it is a specific offence to plant or otherwise cause to grow in the wild (plants) or release or allow to escape into the wild (animals). Many of these are invasive non-native plants and animals, but there are also a number of native animals on the list (e.g. Barn Owl) which cannot be released into the wild in England without a license from Natural England.

The following tables detail the WCA Schedule 9 species recorded in the search area.

Group	Common Name	Scientific Name	Records	Dates	Designations
bird	Barn Owl	<i>Tyto alba</i>	6	1997-2005	MBB-WCA-S9
	Canada Goose	<i>Branta canadensis</i>	1	1999	MBB-WCA-S9
fern	Water Fern	<i>Azolla filiculoides</i>	2	2015	MBB-WCA-S9
flowering plant	Canadian Waterweed	<i>Elodea canadensis</i>	7	1981-2005	MBB-WCA-S9
	Himalayan Balsam	<i>Impatiens glandulifera</i>	174	1987-2021	MBB-WCA-S9
	Japanese Knotweed	<i>Fallopia japonica</i>	35	1981-2019	MBB-WCA-S9
	Japanese Rose	<i>Rosa rugosa</i>	4	2012-2020	MBB-WCA-S9
	Montbretia	<i>Crocsmia pottsii</i> x <i>aurea</i> = <i>C. x crocosmiiflora</i>	1	2012	MBB-WCA-S9
	Rhododendron ponticum	<i>Rhododendron ponticum</i>	39	1968-2018	MBB-WCA-S9
	Three-cornered Garlic	<i>Allium triquetrum</i>	2	2020	MBB-WCA-S9
terrestrial mammal	American Mink	<i>Neovison vison</i>	2	2019-2021	MBB-WCA-S9
	Eastern Grey Squirrel	<i>Sciurus carolinensis</i>	32	1999-2021	MBB-WCA-S9

Desig. Code	Desig. Name	Designation Description
MBB-WCA-S9	Wildlife and Countryside Act 1981 (Variation of Schedule 9) (England and Wales) Order 2010	Species on Schedule 9 (part 2) as revised 2010. Under section 14 of the Act it is illegal to release into the wild any animal or allow to grow in the wild any plant which is not ordinarily resident in GB or which is a known threat and is listed on Schedule 9 of the Act.

BAP priority habitats

In 2007 the Local Biodiversity Manager (responsible for the North Merseyside Biodiversity Action Plan) undertook a review of the extent of UK BAP priority habitats in North Merseyside and produced GIS layers to show their extents. In most cases these inventories were derived from two main sources: the latest Phase 1 habitat surveys which were conducted for the four North Merseyside local authorities between 1996 and 2007; and an NVC survey of the Sefton Coast carried out between 2003 and 2004. A separate NVC survey of the Ribble estuary carried out in 2002 (which also included saltmarsh at the Alt) was also useful as were one or two other sources. Because of the diverse nature of habitat classifications, it was not always possible to produce inventories with a one-to-one correspondence with UK BAP priority habitats. The table below shows the BAP habitat inventories for North Merseyside and their correspondence with UK BAP priority habitats.

North Merseyside habitat inventory	Correspondence with UK BAP priority habitats
Lowland Acid Grassland	Lowland Dry Acid Grassland
Lowland Heathland	Lowland Heathland
Lowland Raised Bog	Lowland Raised Bog
Neutral Grassland	Incorporates the UK BAP habitat Lowland Meadows but also, in North Merseyside, includes a lot of amenity grassland, road verges etc.
Calcareous Grassland	Calcareous Grassland
Ponds	Ponds

Lakes	Eutrophic lakes
Reedbeds	Reedbeds
Hedgerows	Hedgerows
Saltmarsh	Coast Saltmarsh
Sand Dune	Coastal Sand Dune
All Woodland	It was not possible, from the available data, to produce separate inventories for different woodland types in North Merseyside, so this inventory incorporates elements of several UK BAP priority habitats such as Lowland Mixed Deciduous Woodland, Wet Woodland and Wood Pasture & Parkland.

Note that the 'Ponds' BAP inventory was derived locally using water bodies less than two hectares in extent from Ordnance Survey data. The 'Lakes' BAP inventory is a nationally supplied inventory, but the lakes are only represented in this as points. Therefore any water body over two hectares in extent will only be represented on our habitat maps by a point and will not show the extent of the lake. However, ponds will be indicated by polygons showing their extent. Occasionally a large pond – though still less than two hectares in extent – will be represented in both the 'Lake' and 'Pond' inventories.

Habitat	Amount	Units
Ancient Woodland	1	count
Reedbeds	0.23	hectares
Reedbeds	2	count
Hedgerows	41.61	kilometres
Lowland Acid Grassland	7.49	hectares
All Woodland	66.21	hectares
Neutral Grassland	36.33	hectares
Ponds	5.04	hectares
Ponds	113	count

The table above indicates the extent of each of the BAP habitat inventories (see previous table) occurring within your search area (see appendix 3 for maps).

Detailed habitat mapping

Merseyside BioBank collates and maintains detailed habitat mapping – normally Phase 1 or NVC – for the North Merseyside area. This includes both historic data and the most up-to-date habitat survey data available. Here we report on the detailed habitat mapping we hold for your search area.

J1.3	Cultivated/disturbed land - ephemeral/short perennial	1.57 ha
J2.1.2	Intact hedge - species-poor	5.36 km

Habitat maps themselves are produced at the end of the report. You can cross-reference the figures in the tables below to the maps by means of the reference which appears on each map. A map with the reference 'Composite' is a special map made on-the-fly at the time of this report production by merging data from all available sources and using the most up-to-date mapping available at any given point in your search area.

Designated Areas

There are a number of types of 'designated areas' in North Merseyside. These types are shown in the table below together with the total number of North Merseyside sites for each.

Type of area	No. of sites
Site of Special Scientific Interest	6
Special Protection Area (Natura 2000)	3
Marine Special Protection Area	1
Special Area of Conservation (Natura 2000)	1
RAMSAR (wetland of international importance)	3
National Nature Reserve	3
Local Nature Reserve	57
Knowsley Local Wildlife Site	65
Sefton Local Wildlife Site	55
St Helens Local Wildlife Site	117
Liverpool Local Wildlife Site	29
Merseyside Ancient Woodland Inventory	11
RSPB/LWT Windfarm Alert Map	1
Red Squirrel Protection Area	1

The following table indicates the results of the intersection between the search area and designated areas detailed above (see appendix 3 for maps).

Name	Type
The Old Wood	Merseyside Ancient Woodland Inventory
Netherley Brook and Ditton Brook Corridor	Nature Improvement Area
Strettle Bog, Tarbock	Knowsley Local Wildlife Site
Daggers Bridge Wood	Knowsley Local Wildlife Site
Mine Waste, Cronton	Knowsley Local Wildlife Site
Ox Lane Wood, Tarbock	Knowsley Local Wildlife Site
Brickwall Covert	Knowsley Local Wildlife Site
Cartbridge Lane Wood	Knowsley Local Wildlife Site
Green's Bridge Plantation	Knowsley Local Wildlife Site
Netherley Brook	Knowsley Local Wildlife Site
Coppice Lane Council Depot, Huyton	Knowsley Local Wildlife Site
The Old Wood, South	Knowsley Local Wildlife Site
Tributary of Netherley Brook	Knowsley Local Wildlife Site
Mill Brook, Netherley	Knowsley Local Wildlife Site
Ochre Brook, Tarbock	Knowsley Local Wildlife Site
Tarbock Green ditch	Knowsley Local Wildlife Site
Dog Clog Brook, Tarbock	Knowsley Local Wildlife Site
Ditton Brook	Knowsley Local Wildlife Site
Netherley Woods and Brook	Liverpool Local Wildlife Site
Lee Park Golf Course	Liverpool Local Wildlife Site

Interpretation and caveats

Merseyside BioBank records included

All relevant non-confidential records managed by Merseyside BioBank which intersect the search area are included in this report, except where excluded by one or more of the conditions described in the rest of this section.

NBN Atlas records included

All relevant records available to Merseyside BioBank from the NBN Atlas are included in this report, except where excluded by one or more of the conditions described in the rest of this section. NBN Atlas records are accessed live *via* web-services at the time of report generation.

Merseyside BioBank often has access to NBN records at higher resolution than the standard 'public' access. These records have been downloaded and used with the permission of the data providers, but are subject to normal NBN Atlas terms and conditions. You must not use them beyond the specific purposes for which this report was provided to you and you must adhere, at all times, to the NBN Atlas terms and conditions.

Record location and dates

If a record can only be located to a relatively low precision (e.g. 1 km or 2 km square), then it is possible that the unrecorded precise location of the animal or plant might have been outside of the search area. Sometimes the location name column can be useful in deciding whether or not this was likely to have been the case. In records from our own database, we have replaced all digits with the '#' character in the location field to people's privacy where addresses have been used as location names.

Records which are only available to us at less than 2 km square (tetrad) precision are excluded from the report. We report dates at the highest precision available to us. Records for which no date is available are excluded from the report.

Absence of records and 'negative records'

The absence of biological records for an area, or the presence of 'negative records', is not proof that taxa are not present.

Duplicate records

Although we do our very best to avoid reporting the same record more than once ('duplicate records') this is sometimes unavoidable for records that have entered the biological records network *via* more than one route. In particular, there may be some record duplication between records from Merseyside BioBank's database and records from the NBN Atlas datasets (though, of course, we do not report on NBN Atlas records which originate from Merseyside BioBank).

Validity of records

Whilst Merseyside BioBank continually strives to verify the records that we manage, we accept no responsibility for any errors subsequently discovered. Merseyside BioBank accepts no responsibility for errors in data derived from the NBN Atlas.

Verification status of records

Records used in this report include those considered verified and those as yet unchecked. This approach is taken on balance to ensure that all potential risks that we are aware of have been flagged.

Bird records

Only bird records with a recorded status of proven, probable and possible breeding have been included in this data search. Bird records with other statuses are not included. The most recent bird records for North Merseyside included, e.g. those generated for the ongoing breeding and wintering atlas projects, since these data have yet to undergo verification by the County Bird Recorder. It is possible for you to contact the County Bird Recorder independently for his interpretation of the most recent data with respect to your search area. The contact details are:

Steve White
stevewhite102@btinternet.com

Please note that if this is a commercial data request you will be invoiced by **Sefton Borough Council**, which is the hosting authority for Merseyside BioBank.

Appendix 1: Terms and conditions of use

Merseyside BioBank receives data from a variety of sources, from large organisations to amateur naturalists. With Merseyside BioBank operating as custodians, these individuals and groups, who provide their records free of charge, retain copyright on their data.

All data passed to a third party (users) by Merseyside BioBank are subject to these access terms and conditions. Non-adherence to these terms and conditions will be viewed as a breach of contract, which may result in legal redress being sought.

1. Users agree that data released by Merseyside BioBank, in any format and on any media, will only be used for the purpose for which it was originally requested and for any time period originally agreed upon (See note 3 below).
2. Users agree that data released by Merseyside BioBank will not be added to any permanent database system (electronic or paper based) unless by written agreement with Merseyside BioBank.
3. Users understand that following the end of the agreed time period, or 12 months from the enquiry date, the received data must be deleted from any electronic system (See note 2 above). Use of the data beyond this period must be preceded by a further request to Merseyside BioBank.
4. Users agree that data retrieved from Merseyside BioBank will not be passed on to or communicated with third parties except as aggregated data within reports, or as anonymised data in the form of maps etc., which constitute a part of the agreed reason for the original enquiry.
5. Merseyside BioBank disclaims any responsibility for the accuracy of the information within its reports and accepts no liability for any result of using these data.
6. Any biological record is specific to the date of the recording and does not necessarily imply the continuance of the species at that site.
7. The lack of species and/or habitat information for a geographically defined area does not necessarily imply a low biodiversity value for that area. It may simply be unrecorded.
8. While the information from Merseyside BioBank in itself will remain free, Merseyside BioBank reserves the right to charge a reasonable fee to cover administration and a proportion of overheads as detailed in our charging policy.
9. A copy of any report, or other product, produced using the data from Merseyside BioBank would be gratefully received if provided without cost.
10. Merseyside BioBank must be acknowledged within any report, or other product produced, using data provided by Merseyside BioBank.

Appendix 2: Full species records

The following records for protected, BAP, red-listed, notable and invasive species were found to intersect the search area. (Appendix 3 includes a map to show the location of 1 km and tetrad grid references.) Verification status of each record is shown in the "Verified" column (0 = Unchecked; 2 = Confirmed by a local expert). The source of each record is shown in the final column (BioBank = Merseyside BioBank; NBN = NBN Atlas).

Appendix 3: Maps

The following page(s) include maps to illustrate some of the results of your data request. They should be viewed in the context of the results supplied in the main body of the report.

The Ordnance Survey mapping included in the maps provided by Merseyside BioBank under Sefton Council's licence from Ordnance Survey. These maps are provided to assist decision-makers in the effective and sustainable management of land, species and habitats. Ordnance Survey should be contacted directly if any of these maps are to be used in another document.

Site Name: Brickwall Covert, Tarbock

Site Area: 2.45 hectares

National Grid Reference: SJ461877

Date of Designation: 1995

District: Knowsley

Date of Last Revision: July 2003

SBI Number: 24

CITATION: A mature broadleaf and mixed plantation woodland with associated wetland areas.

APPRAISAL: This site has been evaluated against the guidelines approved by the Council for selection of Sites of Biological Interest. The site's evaluation against the guidelines is set out below.

Guideline		Comment
HABITATS		
H1; H2; H3; H4.	Rarity Diversity Nearness Isolation	2 regionally important. 10 habitats recorded. -- --
PLANTS		
SP1; SP2; SP3; SP4.	Rarity Diversity Naturalness Nationally Rare	1 WCA Schedule 8; 1 species of conservation concern; 1 regionally important; 3 locally rare species. Total of 97 plant species. 89.7% of the plants are native to North Merseyside. Colonisation has been aided by man and the site has been physically altered. --
ANIMALS		
General SP5; Birds B1; B2; B3; B4; B5. Dragonflies Od1; Od2. Butterflies Bf1; Bf2. Amphibians A1; A2. Reptiles R2; Bats Bat1; Bat2. Mammals Mam1.	Rare/priority Non-breeding population Breeding population Regional rare/scare Breeding assemblage Assemblage, breeding, wintering, passage. Breeding Regional rare/scarce Region rare breeding Breeding assemblage Rarity Exceptional populations Exceptional population Roost Assemblage Breeding	-- -- -- -- -- -- -- -- -- -- -- -- -- -- --

SUMMARY: The combination of these factors has led to this site being identified as a Site of Biological Interest.

NOTE: Validated data from 1981 to July 2003 have been used in this assessment. Other data may become available to support this designation.

Site name: Lee Park Golf Course**LWS Number 16****Site area:** 50.64 hectares**National Grid Reference:** SJ440879**Date of Designation:** November 2017**District:** Liverpool**Date of Last Revision:****CITATION:**

A golf course containing a mosaic of habitats which provides important wetland habitats. Ponds on site provide habitat for Great crested newt, smooth newt, common toad. Ponds support an assemblage of ten dragonfly species as well as the nationally scarce species galingale together with other wetland species. English bluebell is present within woodlands on site.

APPRAISAL:

This site has been evaluated against the North Merseyside Local Wildlife Sites Selection Guidelines which are approved by the Council for selection of Local Wildlife Sites. The site's evaluation against the guidelines is set out below.

Guideline		Comment
HABITATS		
H1	Rarity	4 Priority habitats; 1 regionally important habitats
H2	Diversity	11 habitats recorded
H3	Nearness	--
H4	Isolation	--
PLANTS		
Sp1	Rarity	1 Wildlife and Countryside Act species, 2 Regionally important species, 1 locally rare species.
Sp2	Diversity	A total of 110 plant species has been recorded.
Sp3	Naturalness	83.6% of the plants are native to the city. Colonisation has been aided by man and the site has been physically altered.

Environmental
Advisory Service

Site name: Netherley Brook and Woods

Site area: 5.25 hectares

National grid reference: SJ447881

Date of designation: 2008

District: Liverpool

Date of last revision: March 2010

Local Wildlife Site number: 13

Citation:

The site is a mosaic of woodland, grassland and running water. It is the most isolated of Liverpool's Local Wildlife Sites but is close to farmland around Tarbock which is of interest for a range of principally farmland birds.

The woodland is of artificial origin and is dominated by Horse Chestnut and Sycamore but also contains lime, Aspen, Field Maple, Hawthorn and Silver Birch, with an understorey of bramble. A patchy ground flora includes Male Fern, Bluebell, Ivy, Lesser Celandine and Ramsons.

The main grassland areas are semi-improved and dominated by Perennial Rye-grass and Yorkshire Fog, but unkempt margins support a greater floristic diversity, including Meadow Foxtail, Common Vetch and several ruderal species.

The Netherley Brook supports a population of Water Voles. It supports some aquatic species including Marsh-marigold but the bankside vegetation is dominated by Great Willowherb and Indian Balsam.

Appraisal:
