EXECUTIVE SUMMARY

Appointment	Curtins were instructed by Rider Levett Bucknall on behalf of Liverpool FC to undertake a Phase 1 Preliminary Risk Assessment (PRA) for a site located at the Liverpool FC Academy, The Liverpool Way, Liverpool L33 7ED. It is understood that proposed development will comprise of the construction of a new indoor pitch and link building, new show pitch with spectator stand, extension of the existing carpark, extension and refurbishment of the existing Academy Building, all with associated hard and soft landscaping.
Current Site Status	The site is currently in use as Liverpool FC Academy and comprises of two academy buildings, an indoor pitch, two outdoor pitches, and a hardstanding car park with associated soft/hard landscaping. The site is irregular in shape and is approximately 5.63 Ha.
Site History	Earliest available mapping (1850) shows the site as agricultural land, with a farm building labelled 'Fazakerley's Farm' and an orchard located at its centre, and an access track extending from the building to the northwestern boundary. 'Potter's Lane' is shown to pass through the southern corner of the site, running west to northeast. No significant changes on site occur until 1968 where the farm building, orchard and access track are no longer present. There is now part of a football ground labelled 'Kirkby Town FC' and electric substation present along the southern boundary, the rest of the site is a playing field. By 1994, mapping shows the football ground and electrical substation are no longer present. The entire site is now a playing field. By 2001 the site is now occupied by the buildings, football pitches, hardstanding carpark and hard/soft landscaping associated with the Liverpool FC Academy. There is also an electric substation located along the northwestern site boundary. In 2018, a building known as the family suite was constructed to the north of the astroturf pitch. In 2023 an attenuation tank was constructed immediately south of the caretakers yard. No further changes have occurred on site to the present day.
Mapped Geology	BGS records indicate the presence of Made Ground beneath the southeast of the site. Due to the phases of construction that have taken place on site it is considered likely that Made Ground may be present across the entire site. Superficial Soils are noted as the Shirdley Hill Sand Formation, comprising coastal blown sands. The underlying bedrock formation is noted as the Chester Formation, comprising cross bedded, pebbly sandstone with subordinate beds of mudstone. There are no BGS recorded faults onsite or within 150 m of the site. The closest fault is recorded c. 1600 m west of the site aligned northwest to southeast down throwing to the northeast with unknown displacement.
Hydrogeology	The Shirdley Hill Sand Formation is noted as a Secondary A Aquifer The Chester Formation is noted as a Principal Aquifer. The site is located within a Source Protection Zone (SPZ) - Zone 3. The nearest potable abstractions are >1000m from site. There is one groundwater abstraction located on-site, held by Liverpool Football Club & Athletic Grounds Limited for Sports Grounds/Facilities: Spray Irrigation – Direct.
Hydrology	The Envirocheck Report indicates the closest significant surface water features is an inland river located c. 680 m north of the site. No pollution incidents have been recorded within 500m of the site within the last 10 years. There are no surface water abstractions within 1km of the site. There are no active discharge consents within 700m of the site.
Landfill and Pollution	There are no historical landfills located within 250 m of the site. There are two active licensed waste management facilities located within 250 m of the site. The closest record is located 94 m east of site, the site category is not supplied. There are two Local Authority Pollution Prevention and Control Permits located within 250 m of the site. The closest record is located 156 m east of site for mobile screening and crushing processes (PG3/16). There is one record of potentially infilled land (water) within 250 m of the site. The record is located 236 m north of the site and is described as unknown filled ground (pond, marsh, river, stream, dock etc.). There are two planning hazardous substances consents within 250 m of the site. The closest record is located 218 m east of the site and is for a combination of dangerous substances.
Unexploded Ordnance (UXO)	Curtins Preliminary UXO risk assessment identified an elevated risk from buried UXO to Curtins ground investigation works. Mott MacDonald Ltd have previously procured a Detailed UXO Risk Assessment for the site. A High risk from UXO was concluded, accounting for: - ROF Kirkby was situated partially on-site and immediately east and would have been considered a primary bombing target during WWII. - ARP recorded bomb strikes on site and within the surrounding area, and the proximity to ROF Kirkby.

Initial Ground Contamination Assessment	• Since WWII, Ordnance has been discovered within close proximity to the Study Site and it is considered probable that they were linked to ROF Kirkby. Additional ammunition may have been deliberately buried. • Since WWII, several buildings have been constructed on site. It is likely that any UXO within the structural footprint of post-war buildings would have been discovered and removed, however, the potential for UXO to be present below existing foundations and within undeveloped areas is assessed to remain extant. The Principal Contractor appointed for the enabling and construction works must obtain their own Detailed UXO Risk Assessment Report to advise their specific works, where they deem to be required.
	A Moderate/Low risk has been identified of on-site direct contact, ingestion and inhalation to end users of the site. A GQRA as part of a ground investigation is recommended. A Low risk has been identified from on-site direct contact, ingestion and inhalation to adjacent site users. No further action required. A Low risk has been identified from on-site vertical and/or lateral migration of contamination through the underlying strata including Made Ground, residual soils and bedrock deposits to controlled groundwater. A GQRA as part of a ground investigation as part of confirmatory testing is recommended. A Very low risk has been identified from on-site vertical and/or lateral migration of contamination through the underlying strata including Made Ground, residual soils and bedrock deposits to controlled surface waters. No further action required. A Low risk has been identified from of off-site lateral migration though shallow soil, followed by direct contact, ingestion and inhalation to end users of the site. No further action required. A Low risk has been identified from on and off-site soils with the potential to generate ground gases through vertical and horizontal migration through the Made Ground, residual soul and bedrock deposits to end users of the site. A programme of confirmatory monitoring is recommended, alongside groundwater monitoring.
Recommendations	In summary the following recommendations are made: • Undertake an intrusive ground investigation to support civil and structural design. • Undertake screening of site soils (visual and olfactory) with basic contamination screening (laboratory testing) to inform CDM and preliminary waste assessment. Additional testing should be undertaken if and where any markers of contamination are revealed. • Undertake a GQRA to further assess the risk presented by contamination to human health, groundwater and ground gas. • Undertake screening of groundwater to assess likelihood of groundwater source/pathway enabling.

1 INTRODUCTION

1.1 Project Background

Curtins were instructed by Rider Levett Bucknall on behalf of Liverpool FC to undertake a Phase 1 Preliminary Risk Assessment (PRA) for a site located at the Liverpool FC Academy, The Liverpool Way, Liverpool L33 7ED.

It is understood that proposed development will comprise of the construction of a new indoor pitch, new show pitch with spectator stand, extension of the existing carpark, extension and refurbishment of the existing Academy Building, all with associated hard and soft landscaping.

Proposed development plans are enclosed in Appendix A.

1.2 Scope of Services

The Phase 1 PRA is intended to provide an overview of the geo-environmental and geo-technical setting of the site.

These works are undertaken in general accordance with the LCRM: Stage 1 risk assessment (1). Through this overview the Phase 1 PRA aims to develop both a working conceptual and ground model for the site, as well as present an initial assessment of any risks that could be presented to the development including its intended end users and the wider environment.

Specifically, the Phase 1 PRA provides an initial assessment of the site regarding:

- a) Potential contamination of the site strata by historical and or current use;
- b) The potential impact on the wider environment by historical and or current use of the site of interest;
- c) The potential impact from surrounding land uses and other environmental factors;
- d) Potential problems associated with geological features such as faulting, mineral extraction, mining, and land instability;
- e) The location of apparent sub-surface structures that may affect the proposed redevelopment; and
- f) The location of above-surface features that may affect the proposed redevelopment.

The production of the Phase 1 PRA is a desk-based exercise, with no ground investigation or intrusive works undertake in support of its findings. Consideration of detailed flood risk, ecology and archaeological issues are outside of the scope of this report.

2 CURRENT SITE AND SURROUNDING AREA DETAILS

Site use, location and description are shown below in Table 1 and Figure 1.

Table 1 – Site Details

Site Address	Liverpool FC Academy, The Liverpool Way, Liverpool L33 7ED
NGR	342370, 398490
Topography	Topographical survey mapping indicates the site to be relatively flat. The highest point on site is recorded as 39.55 m AOD (above Ordnance Datum) in the east of the site, generally falling to the west and north, with the lowest point located in the northwest at 36.90 m AOD. The wider topography of the area is also relatively flat, with ground levels dropping slightly to the north. The site is irregular in shape and is approximately 5.63 Ha.
Current Site Use and Description	The site is currently in use as Liverpool FC Academy and comprises of two academy buildings, an indoor pitch, two outdoor pitches, and a hardstanding car park with associated soft/hard landscaping.

Figure 1 – Site Location Plan (site boundary shown in red)

2.1 Surrounding Area Details

The following information was also established during the site visit and through undertaking an environmental database search (Envirocheck report (2) included in Appendix B).

Table 2 – Surrounding Area

Surrounding Area	N	The northern boundary of the site is marked by soft landscaping and an access track into the wider Liverpool FC Training Grounds, beyond which football pitches are present.
	E	The eastern boundary of the site is marked by soft landscaping and vegetation. Arbour Lane is present just beyond the boundary, followed by an industrial park development.
	S	The southern boundary of the site is marked by soft landscaping and vegetation. Commercial developments are present just beyond the boundary, followed by County Road (A5208).
	W	The western boundary of the site is marked by soft landscaping and vegetation. Simonswood Lane is present just beyond the boundary, followed by a residential development.

3 SITE HISTORY

A review of the available historical mapping and other information for the site, as presented within the Envirocheck report (2), has been undertaken and is presented in Table 3 below. **Bold** text indicates within the site boundary.

Table 3 – Previous Site and Surrounding Area Uses and Potential Sources of Contamination

Date	Description	Potential Sources of Contamination
1850 - 1927	The earliest available mapping (1850) shows the site as agricultural land, with a farm building labelled 'Fazakerley's Farm' and an orchard located at its centre, and an access track extending from the building to the northwestern boundary. 'Potter's Lane' is shown to pass through the southern corner of the site, running west to northeast. 1850 mapping records mainly agricultural fields surrounding the site with 'Simonswood Lane' running along the western site boundary, 'Potter's Lane' running across the southeastern site boundary, and 'Arbour Lane' running north to south approximately 50 m to the east of site. It also shows a quarry (disused) approximately 215 m south of the site. 1908 mapping records show between there is a blacksmith/Victoria forge present approximately 100 m southwest of site. Limited development is recorded within 250 m of the site between 1850 to 1927.	• Potential for uncontrolled deposition of Made Ground associated with local construction/demolition works. • Off-site sources of contamination are unlikely to affect the site given their relative locations to the site and absence of a viable pathway.
	No significant development identified. 1956 mapping shows large site with numerous small buildings, possibly a military site. This is likely ROF Kirkby. 1961 mapping show the blacksmith/Victoria forge is no longer present. By 1962 a factory and warehouses are present approximately 150 m southwest of the site boundary. Between 1961 and 1966 mapping shows residential development approximately 25 m west and 175 m southwest of the site.	• Off-site sources of contamination are unlikely to affect the site given their relative locations to the site and absence of a viable pathway. • UXO risk assessed separately.
1968 - 1993	By 1968 the farm building, orchard, access track and 'Potter's Lane' are no longer present. There is now part of a football ground labelled 'Kirkby Town FC' and electric substation present along the southern boundary, the rest of the site is a playing field. 1968 mapping shows the rest football ground labelled 'Kirkby Town FC' present adjacent to the southern site boundary, and that 'Potter's Lane' is no longer present. The factory and warehouses are now labelled 'Woodwork Factory' and 'Engineering Works'. There is a 'Paper Works' present approximately 80 m west of site. There are also 'Tanks' present approximately 100 m west of site. Between 1968 and 1993 mapping shows further residential development to the west and southwest of the site.	• Potential for uncontrolled deposition of Made Ground associated with local construction/demolition works. • Potential for localised polychlorinated biphenyls (PCBs) associated with historic electric substation. • Off-site sources of contamination are unlikely to affect the site given their relative locations to the site and absence of a viable pathway.
1994 - 1999	1994 mapping shows the football ground and electrical substation are no longer present. The entire site is now a playing field. Mapping records from 1994 show a 'Play and Resource Centre' is now present approximately 70 m southwest of the site boundary. Limited development is recorded within 250 m of the site between 1994 to 1999.	• Potential for uncontrolled deposition of Made Ground associated with local construction/demolition works.
2001 - 2006	By 2001 the site is now occupied by the buildings, football pitches, hardstanding carpark, and hard/soft landscaping associated with	• Potential for uncontrolled deposition of Made Ground

Date	Description	Potential Sources of Contamination
Present Day	Liverpool FC Academy. There is also an electric substation located along the northwestern site boundary. 2001 mapping shows a 'Leisure Centre' is present approximately 40 m south of the site boundary, and another building is present adjacent to the northern site boundary. Limited development is recorded within 250 m of the site between 2001 to 2006.	associated with local construction/demolition works. • Potential for localised fuel spills and leakages associated with hardstanding carparks and roads located onsite. • Potential for uncontrolled deposition of Made Ground associated with local construction/demolition works.
	Present day mapping shows no significant development from the early 2000s mapping. From satellite imagery, in 2018, a building known as the family suite was constructed to the north of the astroturf pitch. In 2023 an attenuation tank was constructed immediately south of the caretakers yard. Limited development is recorded within 250 m of the site between 2006 to present day. No further changes have occurred on site to the present day.	• Potential for localised fuel spills and leakages associated with hardstanding carparks and roads located onsite. • Potential for uncontrolled deposition of Made Ground associated with the construction works.

Potential sources of on-site contamination are further discussed in *Section 6.0*

4 GEOLOGY, HYDROGEOLOGY AND HYDROLOGY

4.1 Geology and Hydrogeology

A study of the Envirocheck records (2), British Geological Survey (BGS) GeoIndex Onshore Viewer (3) indicates the following geological and hydrogeological succession underlying the site:

Table 4 – Geological / Hydrogeological Succession

Geology	Associated Hydrogeological Classification
BGS records indicate the presence of Made Ground beneath the southeast of the site. Due to the phases of construction that have taken place on site it is considered likely that Made Ground may be present across the entire site.	N/A
Shirdley Hill Sand Formation ¹	Secondary A ²
Chester Formation ³	Principal ⁴

Notes:

1. The sediments are interpreted as coastal blown sands and comprise moderately to well-sorted, fine-grained sand with peat layers in the lower part.
2. Secondary A Aquifers comprise permeable layers that can support local water supplies, and may form an important source of base flow to rivers.
3. Cross-bedded, pebbly sandstone with subordinate beds of mudstone.
4. Principal Aquifers provide significant quantities of drinking water, and water for business needs. They may also support rivers, lakes and wetlands.

There are four BGS borehole records located in the northeast of site. Details of these records are presented in Table 5 below.

Table 5 – BGS Borehole Records

Record Number	Location	Details (Depth to base of strata (m bgl), Description and Thickness (m))
SJ49NW1394	342456, 398603 On-site	10.00 – Soft sands with small bands of sandstone (salmon in colour) (10.00) 106.00 – Extremely hard cemented bands of sandstone separated by layers of silt soft sands and clay (96.00) Borehole completed at 106.00 m bgl No Groundwater encountered
SJ49NW1166	342446, 398603 On-site	0.20 – Soil (0.20) 2.10 – Made ground/fill (1.90) 110.00 – Sandstone (107.90) Borehole completed at 110.00 m bgl Groundwater encountered at 7.00 m bgl
SJ49/70	342460, 398570 On-site	0.30 – Topsoil (0.30) 4.00 – Clay (3.70) 15.00 – Red sandstone (11.00) 16.00 – Band of white sandstone (1.00) 47.50 – Red sandstone (31.50) 48.30 – Band of white sandstone (0.80) 70.30 – Red sandstone (22.00) 70.80 – Band of brown sandstone (0.50) 81.00 – Red sandstone (10.20) Borehole completed at 81.00 m bgl Groundwater encountered at 4.20 m bgl

Record Number	Location	Details (Depth to base of strata (m bgl), Description and Thickness (m))
SJ49/69	342450, 398580 On-site	0.30 – Topsoil (0.30) 1.05 – Sand (0.75) 3.85 – Clay (2.80) 14.35 – Red sandstone (10.50) 15.00 – Band of white sandstone (0.65) 45.00 – Red sandstone (30.00) 45.50 – Band of white sandstone (0.50) 71.50 – Red sandstone (26.00) 71.80 – Band of brown sandstone (0.30) 98.00 – Red sandstone (26.20) Borehole completed at 98.00 m bgl Groundwater encountered at 4.00 m bgl

There are no BGS recorded faults onsite or within 150 m of the site. The closest fault is recorded c. 1600 m west of the site aligned northwest to southeast downthrowing to the northeast with unknown displacement.

The site is located within a Source Protection Zone (SPZ) - Zone 3. The nearest potable abstractions are >1000m from site.

There is one groundwater abstraction located on-site, held by Liverpool Football Club & Athletic Grounds Limited for Sports Grounds/Facilities: Spray Irrigation – Direct.

4.1.1 Mining

The Envirocheck Report (2) and the Mining Remediation Authority's Interactive Map Viewer (4) confirms that the site is not situated within a Coal Mining Reporting Area. There is one BGS recorded mineral sites within 250 m of the site, a disused sandstone quarry located c. 215 m south of site. Based on the above information, no further investigation of mining or mineral extraction is required.

4.1.2 Other Ground Stability Issues

The Envirocheck Report confirms the following in relation to potential geotechnical hazards highlighted in Table 6 below:

Table 6 – Ground Stability Hazards for the site.

Ground Stability Hazard	Hazard Potential On-site
Collapsible Ground	Very Low
Compressible Ground	No Hazard
Ground Dissolution (Soluble Rocks)	No Hazard
Landslide	Very Low
Running Sand	Low
Shrinking or Swelling Clay	No Hazard

Given the information above there is unlikely to be a need to address any of the ground stability hazards. However, intrusive ground investigation works will confirm the nature of the ground conditions at the subject site.

4.1.3 Radon Ground Gas

The Envirocheck report (2) indicates that the site is located within a lower probability radon area (Less than 1% of homes are estimated to be at or above the radon action level. In accordance with BR211 (5) no radon protection measures are required.

If this document is being referred to by an employer/prospective employer utilising space in the proposed development as workplaces, they are reminded of their responsibilities in respect of radon in the workplace under the Health and Safety at Work Act 1974. This is a reminder of legal requirements an employer should be aware of and comply with. This is not related to and does not impact upon the Local Authority Planning requirements and the discharge of conditions advised by a planning application decision notice.

4.2 Hydrology

The Envirocheck Report indicates the closest significant surface water features is an inland river located c. 680 m north of the site.

No pollution incidents have been recorded within 500m of the site within the last 10 years.

There are no surface water abstractions within 1km of the site.

There are no active discharge consents within 700m of the site.

4.3 Landfill and Pollution

There are no historical landfills located within 250 m of the site.

There are two active licensed waste management facilities located within 250 m of the site. The closest record is located 94 m east of site, the site category is not supplied.

There are two Local Authority Pollution Prevention and Control Permits located within 250 m of the site. The closest record is located 156 m east of site for mobile screening and crushing processes (PG3/16).

There is one record of potentially infilled land (water) within 250 m of the site. The record is located 236 m north of the site and is described as unknown filled ground (pond, marsh, river, stream, dock etc.).

There are two planning hazardous substances consents within 250 m of the site. The closest record is located 218 m east of the site and is for a combination of dangerous substances.

5 PREVIOUS REPORTS

A ground investigation report has been made available to Curtins for review undertaken across the wider LFC training ground site including the development of the AXA training centre to the north. Specific information pertaining to the LFC Academy development area have been extracted from the report and is summarised below.

It is understood that no reliance can be placed on this information.

5.1 Proposed Training Campus for Liverpool Football Club and Enhancements, Mott Macdonald (May 2017)

Mott Macdonald Ltd (MML) were commissioned by Liverpool Football Club and Athletic Grounds Ltd (LFC) to design and interpret an intrusive ground investigation in 2017 to provide ground data and supporting information to support redevelopment of the club's training ground at Kirkby in the metropolitan borough of Knowsley in Merseyside.

Relevant ground investigation data used within MML's interpretative assessment pertaining to the Liverpool FC Academy development site is summarised below.

5.1.1 Ground Conditions Encountered

The most relevant exploratory hole locations under the proposed indoor pitch have been reviewed. Made ground was encountered to a maximum depth of 4.70 m bgl and typically comprised granular material with demolition debris, some locations also encountered cohesive material with demolition debris. Beneath the Made Ground, two natural granular deposits occur Glaciofluvial Sand (reddish brown with ~15% subangular gravel) and completely Weathered Sandstone derived from bedrock. Sandstone bedrock was confirmed at 1.40 m bgl (35.06 m AOD) at the in the northwest corner and approximately 5.10 m bgl (33.11 m AOD) in the southeast corner of the proposed indoor pitch.

Groundwater levels with a response zone in the sandstone bedrock had levels stable levels varying from 5.20 m bgl (33.01 m AOD) to 2.70 m bgl (33.80 m AOD), indicating the groundwater table is situated near the surface of the underlying sandstone bedrock. The monitoring point with a response zone in granular Made Ground had groundwater levels fluctuating between 1.50 m bgl (34.96 m AOD) and 1.90 m bgl (34.96 m AOD) indicating a locally higher groundwater level, probably water percolating downwards from the ground surface perched on clay horizons within Made Ground.

5.1.2 Pertinant Findings

Analysis of the soils by MML identified asbestos within two locations. No other exceedances of relevant screening criteria were identified.

Screening values were calculated from measured methane and carbon dioxide concentrations in keeping with BS 8485. Most screening values fell were constantly below 0.07 l/hr. Screening values calculated from the concentration and flows measured during the first round of monitoring did yield screening values of 0.180 and 0.07 l/hr. However, these values were not maintained over subsequent monitoring visits, and the ground is therefore not considered to be actively gassing. From the overall trend in Gas Screening Values, the Characteristic Situation of the site was considered to be Characteristic Situation 1 (CS1) by MML.

No exceedances were identified in groundwaters sampled within the area of the development site. However, a number of exceedances of UKDWS and EQS detection limits along with other contaminants were identified in leachates and groundwaters across the wider site. An examination of the contaminants and results has shown that risks to controlled waters from site soils are limited in nature and are unlikely to significantly benefit from either further contaminant modelling or remedial action. The majority of the generally low-level leachable contaminants were identified across the site within Made Ground Deposits and topsoil with no specific historic or, current point source identified.

A Detailed UXO risk assessment was procured by MML and concluded a high risk from UXO on site. This considers an elevated risk from German UXO and allied UXO.

5.1.3 Conclusions and Recommendations

Minor exceedances were encountered against risks to Controlled Waters. Removal of Made Ground from the site was not considered sustainable or cost-beneficial for the risks identified by MML.

MML recommended that specialist advice should be sought regarding the significance and appropriate mitigation of the asbestos identified within two exploratory locations in the Proposed Indoor Pitch Area.

Risk from unexploded ordnance was flagged a high due to bombing raids on the Royal Ordnance Factory Kirkby that took place during WWII. Risks to ground investigation operatives were mitigated by the use of magnetometer techniques within boreholes pre-empt detect buried metallic bodies. No anomalies were identified.

6 PRELIMINARY UNEXPLODED ORDNANCE RISK ASSESSMENT

Military activities including those conducted as part of both the First and Second World Wars have resulted in a legacy of unexploded ordnance (UXO) being present within the shallow soils of the UK.

UXO result from various sources including both allied (military training) and German (bombing raids) with a guide figure of approximately 10% of all munitions failing to function as designed.

An assessment of the likelihood of being UXO encountered has been undertaken to advise any intrusive ground investigation in the event that this is undertaken by Curtins. This risk is influenced by a number of factors including the proximity to strategic targets, the nature of the works being undertaken and evidence of local damage in the post-war periods amongst others. In order to determine the likelihood of UXO being present on a site, a stepwise risk assessment process is followed. This process is outlined within CIRIA C681 Unexploded Ordnance: A Guide for the Construction Industry.

6.1 Preliminary UXO Assessment

It should be noted that the following assessment will only be applicable to future works with respect to ground investigation works completed by Curtins only. This includes trial pitting and boreholes to determine the nature of the ground conditions for geo-environmental and geotechnical information. Where the client is looking to determine the risk from UXO throughout the entire enabling works and construction phase of the below ground level development, the Principal Contractor appointed for the enabling and construction works must obtain their own Detailed UXO Risk Assessment Report to advise their specific works, where deemed to be required by the Principal Contractor.

The risk presented by Unexploded Ordnance, identified using preliminary Unexploded Bomb (UXB) risk maps retrieved from Zetica UXO (6), indicates that the site is situated in a designated Low-Risk area in respect to the potential presence of UXB as a result of World War Two bombing.

The Envirocheck Report historical mapping (2) does not indicate any ruins surrounding the site in post war mapping. The site has undergone significant construction works post war, further limiting the potential of encountering UXO during the ground investigation.

However, given the proximity of the site to Royal Ordnance Factory Kirkby during the Second World War, an elevated risk is identified.

As discussed in Section 5, Mott Macdonald Ltd have previously produced a Detailed UXO Risk Assessment for the site. A **High** risk from UXO was concluded, accounting for:

- *ROF Kirkby* was situated partially on-site and immediately east and would have been considered a primary bombing target during WWII.
- ARP recorded bomb strikes on site and within the surrounding area, and the proximity to *ROF Kirkby*.
- Since WWII, Ordnance has been discovered within close proximity to the Study Site and it is considered probable that they were linked to *ROF Kirkby*. Additional ammunition may have been deliberately buried.
- Since WWII, several buildings have been constructed on site. It is likely that any UXO within the structural footprint of post-war buildings would have been discovered and removed, however, the potential for UXO to be present below existing foundations and within undeveloped areas is assessed to remain extant.

In relation to ground investigation works, the report made a number of risk mitigation recommendations including:

- i) UXO risk management plan.
- ii) UXO safety awareness briefings
- iii) EOD banksman support.
- iv) Magnetometer survey.

Based on the foregoing commentary it is recommended that these risk mitigation measures are put into place for Curtins Ground Investigation works.

For below ground demolition or construction works the principal contractor should carry out their own UXO risk assessments with specific consideration of their scope of works. Specialist input/ assessment with reliance is advised.

If unexploded ordnance is discovered, stop immediately, prevent access to the area, and inform the police. If the site boundary or location changes then the UXO risk should be reassessed.

7 PRELIMINARY CONCEPTUAL SITE MODEL & QUALITATIVE RISK ASSESSMENT

The Conceptual Site Model (CSM) and Qualitative Risk Assessment (QRA) are presented in the table presented in this section.

The CSM details the source-pathway-receptor linkages or potential pollutant linkages (PPL) that have been identified for the site. The QRA details the associated level of risk relating to these potential pollutant linkages.

The CSM and QRA concern risk to human health and water environment with additional, more specific risk assessment protocols contained within the main body of this reporting, as detailed in Section 7.1 below.

The QRA follows the framework outlined within CIRIA C552 (7) which is summarised within Appendix H.

The 'risk rating' within the QRA refers to the risk that the source, pathway, receptor linkage or PPL is complete. Unless specifically stated it does not necessarily refer to an immediate risk and is intended to be used as a tool to assess the necessity for further assessment/investigation.

7.1 Additional Risk Assessments

The following risk assessments, listed below, are not included within the main CSM and QRA but none-the-less can be of critical importance to the onward development of the site.

- The risk presented by Mining is discussed and assessed in Section 4.1.1.
- The risk presented by Radon is discussed and assessed in Section 4.1.3.
- The risk presented by Unexploded Ordnance is discussed and assessed in Section 6.1.

Under current health and safety legislation, employers are required to carry out their own appropriate risk assessments and mitigation to protect themselves and their employees, other human receptors, and the environment from potential contamination. Such risks must be adequately mitigated by law, specifically the Construction Design Management (CDM) Regulations (2015) (8) which require that potential risks to human health and the environment from construction activities are appropriately identified and all necessary steps taken to eliminate / manage that risk. It has been assumed that any future construction works on site will be undertaken in compliance with these requirements.

- The table below represents the first stage in the land quality risk assessment process: The Qualitative Risk Assessment.
- For a development site to be deemed ‘suitable for use’, the level of risk needs to be brought down to acceptable levels, i.e. low to negligible risk. The purpose of each stage of risk assessment is ultimately to establish, if there is a requirement for additional levels of assessment to be made to have sufficient confidence to support a risk characterisation or management decision, e.g. remedial action.
- In the absence of specific site data, a Generic Quantitative Risk Assessment is invariably recommended.

Conceptual Site Model				Qualitative Risk Assessment		
Source	Pathway	Receptor	Consequence	Likelihood of Occurrence	Risk Rating	Recommended Actions
On-Site Sources of Potential Contamination: • Potential for uncontrolled deposition of Made Ground associated with local construction works. • Potential for localised fuel spills and leakages associated with hardstanding carparks and roads located onsite. • Potential for localised polychlorinated biphenyls (PCBs) associated with historic electric substation. <i>Potential contaminants of concern associated with the above sources include, amongst others; hydrocarbons including diesel/petrol range organics from fuel spillages, polycyclic aromatic hydrocarbons arising from incomplete combustion, and inorganic compounds including metals, non-metals (from chemical spillages), polychlorinated biphenyls (PCBs), and asbestos.</i>	Direct contact, ingestion, inhalation (dust and vapours)	End users of site	Medium Chronic health risk	Low BGS records indicate the presence of Made Ground beneath the southeast of the site. There have been limited phases of development over the history of the site, therefore a limited thickness of Made Ground is expected to underlie the wider site. The proposed development primarily comprises of building footprints and hardstanding, which decreases the risk to potential end users. However, the proposed soft landscaping areas, including the proposed show football pitch, represent localised zones where potential exposure contaminants in Made Ground may occur. The proposed soft landscaped area above the former substation represents a localised zone where potential exposure to PCBs may occur. However, due to the historical change in site levels over phases of development it is assumed any contaminated soil has been removed from site from this area (current show pitch level significantly reduced to surrounding ground levels). PCB risk is therefore discounted. The previous report identified asbestos within two locations, no other contaminants were identified. Consequently, there is a low likelihood of limited Made Ground presenting a risk to end users of the site. It is recommended that a Generic Quantitative Risk Assessment (GQRA) is undertaken following a ground investigation, to further assess the risk to site end users.	Moderate/ Low	GQRA as part of a ground investigation.
		Adjacent site users	Medium Chronic health risk	Unlikely It is unlikely that gross contamination is present that may adversely affect off site receptors.	Low	No further action recommended.
	Vertical and/or lateral migration through the underlying strata including Made Ground, residual soils and bedrock deposits	Controlled Waters (Groundwater) Shirdley Hill Sand Formation– Secondary A Aquifers On-site groundwater abstraction.	Medium Pollution of sensitive water resources	Unlikely The previous report identified perched groundwater in Made Ground (1.50 - 1.90 m bgl). No contaminant exceedances were identified in groundwaters sampled within the area of the development site. A Low risk to groundwater was concluded. Granular Glaciofluvial Sand and weathered sandstone provide a moderate permeability pathway to the underlying aquifer. Despite the potential presence of contamination in shallow made ground soils, most of the proposed development is anticipated to lie within the building footprint or be covered by hardstanding. This will reduce the likelihood of potential leaching and mobilisation of contamination. One groundwater abstraction is located on-site, and the site lies within a Source Protection Zone, which increases sensitivity. However, the limited mobility of potential contaminants and restricted infiltration lower the likelihood of impact. Consequently, there is a low likelihood of limited Made Ground presenting a risk to controlled waters (groundwater). It is recommended that a GQRA is undertaken following a ground investigation, with confirmatory groundwater testing to support the previous reports findings.	Low	GQRA as part of a ground investigation, with confirmatory groundwater testing.

Conceptual Site Model				Qualitative Risk Assessment		
Source	Pathway	Receptor	Consequence	Likelihood of Occurrence	Risk Rating	Recommended Actions
		Controlled Waters (Surface Water) Unnamed inland river (c. 680 m north)	Mild Pollution of a non-sensitive water resource	Unlikely Given the distance to the surface water receptor and that most of the proposed development is anticipated to lie within the building footprint or be covered by hardstanding which will reduce infiltration and as such limiting contaminant mobilisation.	Very Low	No further action recommended.
Off-site Sources of Potential Contamination: Made ground is likely to be the primary sources of contamination in the vicinity of the site. <i>Potential contaminants of concern associated with the above sources include, amongst others; hydrocarbons from fuel spillages, polycyclic aromatic hydrocarbons arising from incomplete combustion, and inorganic compounds including metals, non-metals (from chemical spillages), and asbestos.</i>	Lateral migration through the shallow soil <i>Followed by...</i> Direct contact, ingestion, inhalation (dust and vapours)	End users of site	Medium Chronic health risk	Unlikely No significant off-site sources of contamination have been identified, that pose a greater risk to future site users than the current risk attached to current on-site sources. The proposed development primarily comprises of the building's footprints and hardstanding, which decreases the risk to potential end users.	Low	No further action recommended.
On and off-site soils with the potential to generate ground gases: Suspected made ground deposits encountered onsite.	Vertical and horizontal migration through the made ground, residual soil and bedrock deposits	End user of site	Medium	Unlikely No historical landfills within 250m of the subject site. Limited on-site and off-site sources of ground gases were identified on historical mapping. With reference to BS8576 (9), the site is considered to have a 'Very Low' gassing potential and as such ground gas monitoring is not required to determine such risk. It is therefore considered unlikely that this contaminant pathway will be realised. Previous report considered the site to be a Characteristic Situation 1 (CS1).	Low	Programme of confirmatory monitoring to be carried out, alongside groundwater monitoring

8 CONCLUSIONS AND RECOMMENDATIONS

8.1 Conclusions

The QRA has identified a Low to Moderate to Low risk to end users and Low risk to groundwater from potential on-site sources of contamination. A Low to Very Low risk to remaining receptors from potential ground contamination.

The risks presented by radon and mining have been assessed to be Low.

Risk mapping for the site for UXOs has placed the site in a low-risk area. However, given the proximity of the site to Royal Ordnance Factory Kirkby during the Second World War, an elevated risk is identified. A previous Detailed UXO risk assessment report concluded a High risk. Risk mitigation measures are therefore recommended in relation Curtins Ground Investigation works.

8.2 Contaminated Land and Geotechnical Recommendations

The QRA concluded by recommending that a generic quantitative risk assessment (GQRA) should be undertaken to assess the risks to the identified receptors, the scope of such an investigation is subject to development plans.

It is recommended that the GQRA is conducted as part of a ground investigation, in support of the engineering design of the proposed development.

In summary the following recommendations are made:

- Undertake an intrusive ground investigation to support civil and structural design.
- Undertake screening of site soils (visual and olfactory) with basic contamination screening (laboratory testing) to inform CDM and preliminary waste assessment. Additional testing should be undertaken if and where any markers of contamination are revealed.
- Undertake a GQRA to further assess the risk presented by contamination to human health, groundwater and ground gas.
- Undertake screening of groundwater to assess likelihood of groundwater source/pathway enabling.

It is recommended that these works are undertaken prior to any development works taking place.

1.2 PROPOSED MASTERPLAN

PROPOSED SITE PLAN

SUMMARY OF DEVELOPMENT

The masterplan proposals consist of:

- Extending and refurbishing the academy building
- A new full-size artificial indoor pitch
- A new full-size show pitch
- A 499 (maximum) seat spectator stand and associated accommodation such as changing rooms, officials rooms and spectator facilities.
- Replacement of lost parking spaces and some additional parking spaces with coach and mini-bus parking.
- Landscaping, pitch access, and replacement trees.

Introduction

The Environment Act 1995 has made site sensitivity a key issue, as the legislation pays as much attention to the pathways by which contamination could spread, and to the vulnerable targets of contamination, as it does the potential sources of contamination. For this reason, Landmark's Site Sensitivity maps and Datasheet(s) place great emphasis on statutory data provided by the Environment Agency/Natural Resources Wales and the Scottish Environment Protection Agency; it also incorporates data from Natural England (and the Scottish and Welsh equivalents) and Local Authorities; and highlights hydrogeological features required by environmental and geotechnical consultants. It does not include any information concerning past uses of land. The datasheet is produced by querying the Landmark database to a distance defined by the client from a site boundary provided by the client. In this datasheet the National Grid References (NGRs) are rounded to the nearest 10m in accordance with Landmark's agreements with a number of Data Suppliers.

Radon Potential dataset Copyright Notice

Information supplied from a joint dataset compiled by The British Geological Survey and Public Health England. The probability result is only valid for properties above ground. All basement and cellar areas are considered to be at additional risk from high radon levels. If an underground room such as a cellar or basement makes up part of the living or working accommodation, the property should be tested regardless of Radon Affected Area status.

Lancashire And Furness

Published 1850

Source map scale - 1:10,560

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas; these maps were used to update the 1:10,560 maps. The published date given therefore is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas. In the late 1940's, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially overprinted with the National Grid. In 1970, the first 1:10,000 maps were produced using the Transverse Mercator Projection. The revision process continued until recently, with new editions appearing every 10 years or so for urban areas.

Liverpool

Published 1974

Source map scale - 1:10,000

These maps were produced by the Russian military during the Cold War between 1950 and 1997, and cover 103 towns and cities throughout the U.K. The maps are produced at 1:25,000, 1:10,000 and 1:5,000 scale, and show detailed land use, with colour-coded areas for development, green areas, and non-developed areas. Buildings are coloured black and important building uses (such as hospitals, post offices, factories etc.) are numbered, with a numbered key describing their use. They were produced by the Russians for the benefit of navigation, as well as strategic military sites and transport hubs, for use if they were to have invaded the U.K. The detailed information provided indicates that the areas were surveyed using land-based personnel, on the ground, in the cities that are mapped.

10k Raster Mapping
Published 1999
Source map scale - 1:10,000

The historical maps shown were produced from the Ordnance Survey's 1:10,000 colour raster mapping. These maps are derived from Landplan which replaced the old 1:10,000 maps originally published in 1970. The data is highly detailed showing buildings, fences and field boundaries as well as all roads, tracks and paths. Road names are also included together with the relevant road number and classification. Boundary information depiction includes county, unitary authority, district, civil parish and constituency.

10k Raster Mapping

Published 2006

Source map scale - 1:10,000

The historical maps shown were produced from the Ordnance Survey’s 1:10,000 colour raster mapping. These maps are derived from Landplan which replaced the old 1:10,000 maps originally published in 1970. The data is highly detailed showing buildings, fences and field boundaries as well as all roads, tracks and paths. Road names are also included together with the relevant road number and classification. Boundary information depiction includes county, unitary authority, district, civil parish and constituency.

VectorMap Local

Published 2025

Source map scale - 1:10,000

VectorMap Local (Raster) is Ordnance Survey's highest detailed 'backdrop' mapping product. These maps are produced from OS's VectorMap Local, a simple vector dataset at a nominal scale of 1:10,000, covering the whole of Great Britain, that has been designed for creating graphical mapping. OS VectorMap Local is derived from large-scale information surveyed at 1:1250 scale (covering major towns and cities), 1:2500 scale (smaller towns, villages and developed rural areas), and 1:10 000 scale (mountain, moorland and river estuary areas).

Lancashire And Furness

Published 1893

Source map scale - 1:2,500

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas and by 1896 it covered the whole of what were considered to be the cultivated parts of Great Britain. The published date given below is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas.

Appendix C – Qualitative Risk Assessment Rationale

The site-specific risk assessment, presented in this report, follows the principle of establishing whether there is a viable linkage between a contaminant source to a potential receptor, via an exposure pathway.

The risk assessment corresponds with the total site area and incorporates both descriptive (qualitative) and, where available, numerical (quantitative) lines of evidence.

Risk assessment is the process of collating known information on a hazard or set of hazards to estimate actual or potential risk to receptors. The receptor may be humans, a water resource, a sensitive local ecosystem or future construction materials. Receptors can be connected to the source by one or several exposure pathways such as direct contact for example. Risks are generally managed by isolating the receptor or intercepting the exposure pathway or by isolating or removing the hazard.

Without the three essential components of a source, pathway and receptor there can be no risk. Therefore, the presence of contaminant source on a site does not necessarily mean there is a risk.

The risk assessment considers the likelihood of an event taking place (accounting for the presence of the source and receptor and the viability of the exposure pathway) in conjunction with the severity of the potential consequence (accounting for the potential severity of the hazard and the sensitivity of the receptor).

In the risk assessment, the consequence of the hazard has been classified as severe or medium or mild or minor and the probability (likelihood) of the circumstances occurring classified as high likelihood or likely or low likelihood or unlikely.

The consequences and probabilities are subsequently cross-correlated to give a qualitative estimation of the risk using Department of the Environment risk classifications as detailed in the table below and as referenced in CIRIA C552.

		Consequence			
		Severe	Medium	Mild	Minor
Probability (Likelihood)	High Likelihood	Very High Risk	High Risk	Moderate Risk	Moderate/Low Risk
	Likely	High Risk	Moderate Risk	Moderate/Low Risk	Low Risk
	Low Likelihood	Moderate Risk	Moderate/Low Risk	Low Risk	Very Low Risk
	Unlikely	Moderate/Low Risk	Low Risk	Very Low Risk	Very Low Risk

In accordance with DoE guidance, the following categorisation of **consequence** has been developed.

Classification	Definition	Examples
Severe	Short-term (acute) risk to human health likely to result in "significant harm" as defined by the Environment Protection Act 1990, Part IIA. Short-term risk of pollution of sensitive water resource. Catastrophic damage to buildings/property. A short-term risk to an ecosystem or organisation forming part of such ecosystem.	High concentrations of cyanide on the surface of an informal recreation area. Major spillage of contaminants from site into the water environment. Explosion, causing building collapse (can also equate to a short-term human health risk if buildings are occupied).
Medium	Chronic damage to Human Health. Pollution of sensitive water resources. A significant change in an ecosystem or organism forming part of such ecosystem.	Concentration of a contaminant from site exceeds the generic or site-specific assessment criteria. Leaching of contaminants from a site to a Principal or Secondary A aquifer. Death of a species within a designated nature reserve. Lesser toxic and asphyxiate effects
Mild	Pollution of non-sensitive water resources. Significant damage to crops, buildings, structures and services. Damage to sensitive buildings/structures/services or the environment.	Pollution of non-classified groundwater (inc. Secondary B aquifers). Damage to building rendering it unsafe to occupy (e.g. foundation damage resulting in instability).
Minor	Harm, although not necessarily significant harm, which may result in a financial loss or expenditure to resolve. Non-permanent health effects to human health (easily prevented by means such as personal protective clothing, etc). Easily repairable effects of damage to buildings, structures and services.	The presence of contaminants at such concentrations that protective equipment is required during site works. The loss of plants in a landscaping scheme. Discoloration of concrete.

In accordance with DoE guidance, the following categorisation of **probability** has been developed.

Classification	Definition
High Likelihood	There is a pollution linkage and an event that either appears very likely in the short term and almost inevitable over the long term or there is evidence at the receptor of harm or pollution.
Likely	There is a pollution linkage and all the elements are present and in the right place, which means that it is probable that an event will occur. Circumstances are such that an event is not inevitable, but possible in the short term and likely over the long term.
Low Likelihood	There is a pollution linkage and circumstances are possible under which an event could occur. However, it is by no means certain that even over a longer period such event would take place and is less likely in the shorter term.
Unlikely	There is a pollution linkage, but circumstances are such that it is improbable that an event would occur even in the very long term.

In accordance with DoE guidance, the following categorisation of **risk** has been developed.

Classification	Definition
Very High Risk	There is a <i>high probability</i> that <i>severe harm</i> could arise to a designated receptor from an identified hazard at the site without appropriate further action.
High Risk	<i>Harm is likely to arise</i> to a designated receptor from an identified hazard at the site without appropriate further action.
Moderate Risk	<i>It is possible</i> that without appropriate further action <i>harm could arise</i> to a designated receptor. It is relatively <i>unlikely</i> that any such harm would be <i>severe</i> , and if any harm were to occur it is <i>more likely</i> that such harm would be <i>relatively mild</i> .
Low Risk	<i>It is possible</i> that <i>harm could arise</i> to a designated receptor from an identified hazard. It is <i>likely</i> that, at worst, if any harm was realised any effects would be <i>mild</i> .
Very Low Risk	The presence of an identified hazard does not give rise to the potential to cause harm to a designated receptor.

The term 'risk' in this instance refers to the risk that the source, pathway, receptor linkage for a given source of contamination is complete. It does not refer to immediate risk to individuals or features present on the site from potential contaminants and is intended to be used as a tool to assess the necessity of further investigation.
