Woodland planting:

In order to form an irregular woodland trees should be planted randomly, not uniform and also in groups of a given species and size. For example, oaks in groups of 30, faster growing birches in groups of 10 with smaller species randomly distributed in groups of 5 – 20. Only species matched in growth rate should be mixed.

Plant spacing should be 2m on average to promote fast establishment and in clusters of 50m separated by gaps of 7 – 10m, which will eventually close over. Spacing of 3 -4m is also advised occasionally to promote bushier growth, which will provide early opportunities for nesting birds. Where possible, open areas of 25m should be left within the woodland to provide glades. This type of woodland favours plant and animal species of wood margins.
