Hi Maxine.

See below response in red hope this helps.

Methods for the mitigation of noise and vibration from building works (will vibration monitoring be carried out. With such a small demolition project vibration monitoring will not be carried out Where will the monitors be located? See above no vibration monitoring will be carried out What will be the alarm level the monitor is set at?), including any piling works, and from the operation of any temporary power generation or pumping plant which will operate overnight (should be away from noise sensitive buildings and / or make use of acoustic barriers to shield such buildings / details of noise levels from any temporary plant needs to be provided and the location of the generator / ensure it is located as far away as possible from existing residents with any vents facing away from the closest residents) There will not be a generator on site and no piling works are to be undertaken, The demolition works are likely to take 1-2 days with spoil removal afterwards, noise and vibration will not be an issue for such a small demolition project

Regards
Andrew Moss
