

# Storage and site specifications

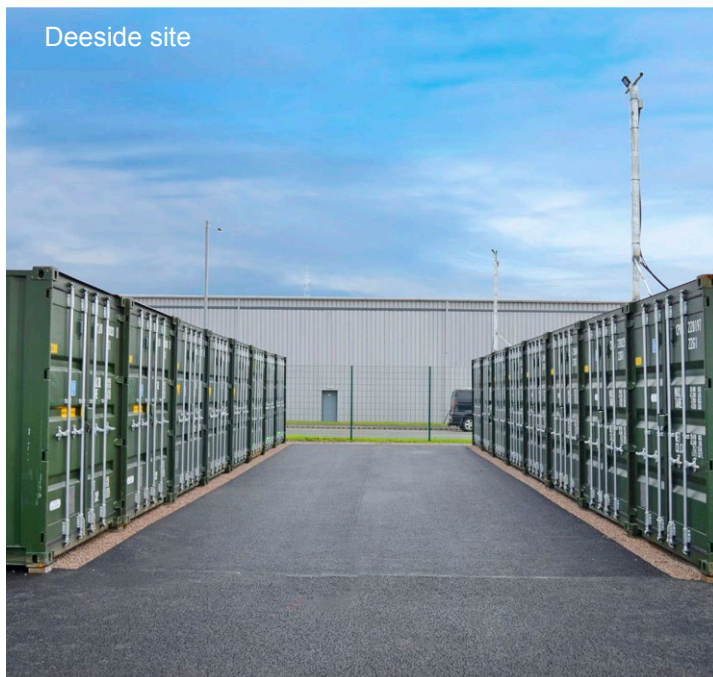

Lock Stock purchases ISO standard containers. We carefully select units that are new and A grade. We continually refresh our stock of units by replacing units that are no longer at the standard we require. Once delivered on site Lock Stock insulates the ceilings of the containers. Whilst many of our local competitors don't do this we believe that this is of great benefit to the goods being stored and our customers agree. Our in-house maintenance team are expertly trained to apply the foam insulation spray and the system used is eco-friendly using refillable cylinders. The containers are packed off the ground to aid air flow and ventilation.

The layout of the site is planned in great detail on computer software by an in house designer to ensure easy access to each unit and to maximise use of the space. The site is carefully landscaped, is low profile and each unit is painted in the company's distinctive dark green colour to blend in and minimise any visual impact.

As the site is very large and every unit has vehicle access, for safety we have a traffic management system in place that includes a restricted speed limit, road markings, speed bumps and give way and stop signs.

The Site is covered by a high definition CCTV system which is recorded and regularly inspected by the Site Manager. Photocell controlled lighting is positioned all around the site which assists with the 24 hour access on offer. The lights are low voltage and strategically positioned across the site to provide direct lighting where required.
