The above refers to items that are Evergreen.

#### Planting Philosophy

All planting has been selected to offer a low maintenance and reliable structured screening belt around the gas works fence line. There is a mix of groundcover, compact shrubs, larger shrubs, small trees, and larger mature specimens. These will offer varied development over time and will allow for improved screening as the scheme matures.

A mixture of quicker growing species, evergreen species and slower maturing species will offer a mixed canopy that will develop over time. This will ensure there is succession within the different canopy, sub-canopy, and ground layers.

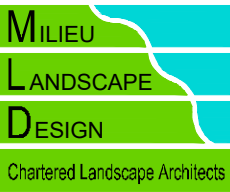

The planting has been designed to ensure there is always an evergreen element within the sight line, this ensures that in winter months where deciduous trees have lost their cover, there is suitable density within the planting to compensate without over planting with evergreens.

We have made sure there is a suitable mix of native plants selected with the scheme to ensure we are not negatively detracting from the natural indigenous capital.

Planting selected is designed to sit harmoniously with the profile of the bund and the low frontage wall proposed. This ensured no frontage species will grow too tall creating anti-social issues or maintenance problems.

Feature planting in the form of cultivars species have been selected for key locations on corners and sight lines to provide seasonal interest within the development.
